Since 2012, the IBR high flux pulsed reactor in Dubna renewed regular operation at nominal power for scientific research. Neutron scattering investigations at IBR-2 reactor cover an extensive field of research in condensed matter physics, materials science, chemistry, biophysical, geophysical and engineering sciences. Currently, 13 facilities (diffractometers, spectrometers and reflectometers) are working under FLNP User Program.

Details about organization of the proposals assessment as well as statistic of proposal realization in the years 2015-2017 will be presented.
