$$I = \frac{dV}{d\tau} + \beta V + \sin \varphi$$

$$V = \frac{d\varphi}{d\tau}, \quad \text{where } \tau = \omega_p t,$$

$$\omega_p = \frac{2eI_c}{\hbar C} \quad \text{and} \quad \beta = \frac{1}{\omega_p R C}$$

**dc Josephson effect:**

$$I_s(\varphi) = I_c \sin \varphi \quad (1)$$

**ac Josephson effect:**

$$\frac{d\varphi}{dt} = \frac{2e}{\hbar} V \quad (2)$$

From (2) it follows that  $\varphi = \frac{2e}{\hbar} Vt + \varphi_0$ .

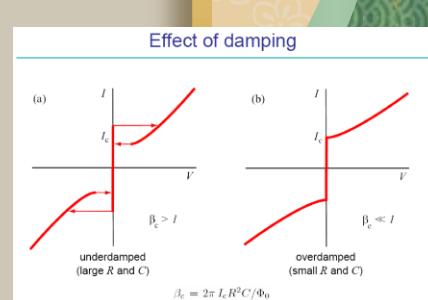

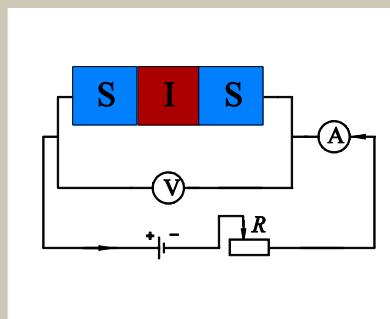

Thus,  $I_s$  oscillates with frequency

$$f = \frac{2e}{2\pi \hbar} V = \frac{1}{\Phi_0} V, \quad (3)$$

where  $\Phi_0 = 2.068 \times 10^{-15}$  Wb is the magnetic flux quantum.

■ Josephson junction is a *quantum dc voltage - to - frequency converter*

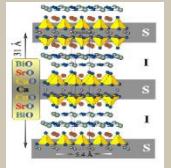

■  $1 \mu V \leftrightarrow 483.59767$  MHz

Applications in the superconducting electronics, quantum metrology, medicine. Particularly, the system is a source of coherent electromagnetic radiation.

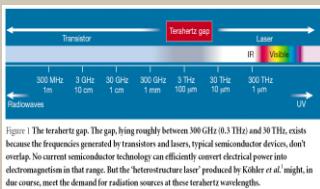

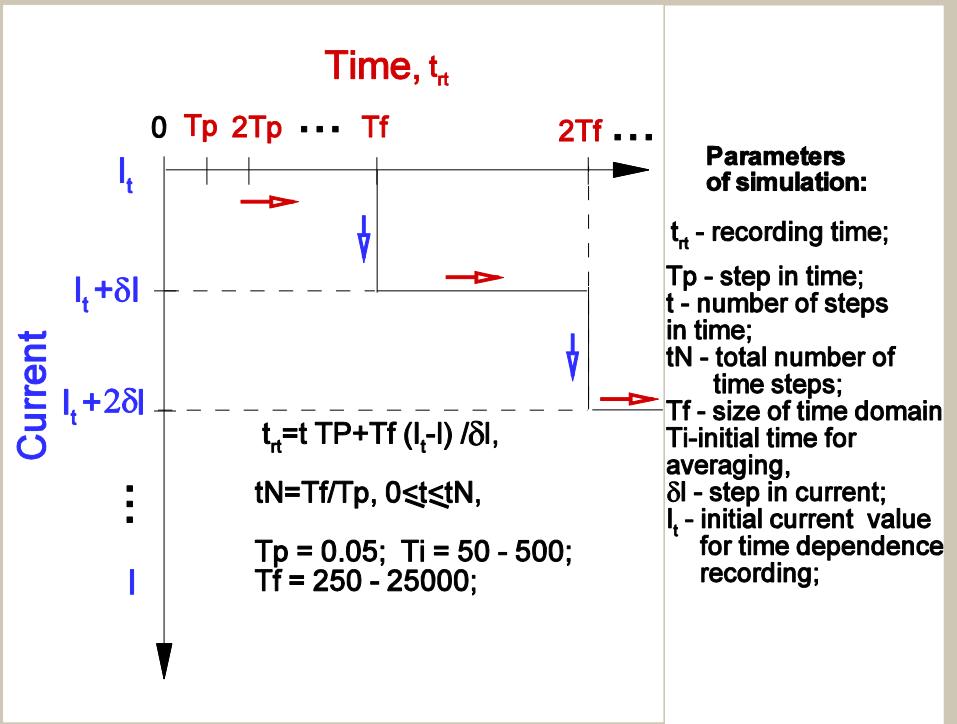

Figure 1 The terahertz gap. The gap, lying roughly between 300 GHz (0.3 THz) and 30 THz, exists because the frequencies generated by transistors and lasers, typical semiconductor devices, don't overlap. No current semiconductor technology can efficiently convert electrical power into electromagnetism in that range. But the "heterostructure laser" produced by Köhler et al. might, in due course, meet the demand for radiation sources at these terahertz wavelengths.

# Simulation procedure for phase dynamics and IV-characteristics

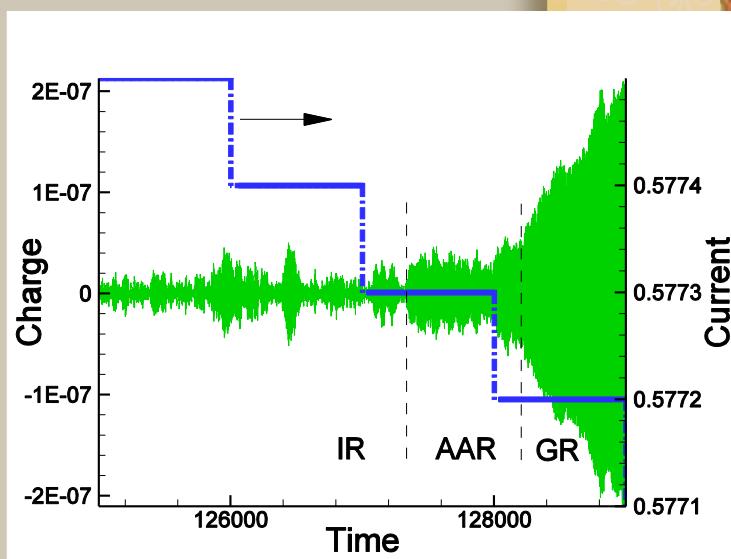

$$\begin{cases} \frac{d\varphi_l}{dt} = V_l - \alpha(V_{l+1} + V_{l-1} - 2V_l) \\ \frac{dV_l}{dt} = I - \sin \varphi_l - \beta \varphi_l + A \sin(\omega t) \end{cases}$$

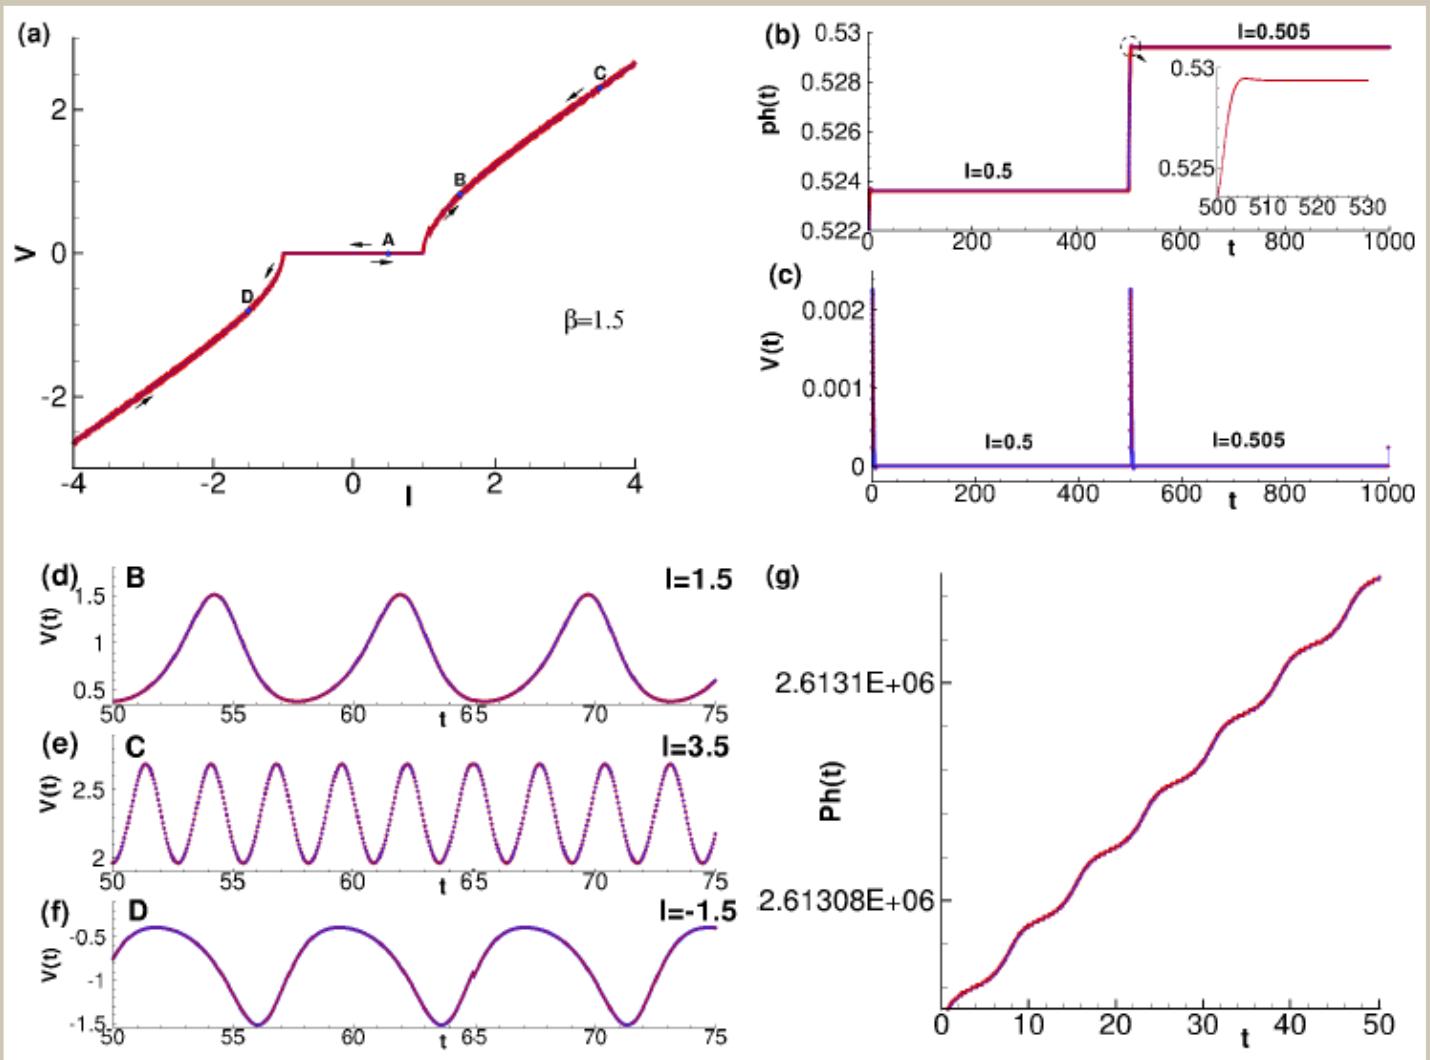

$\operatorname{div} (\epsilon \epsilon_0 \mathbf{E}) = Q$

$$Q_i = Q_0 \propto (V_{i+1} - V_i)$$

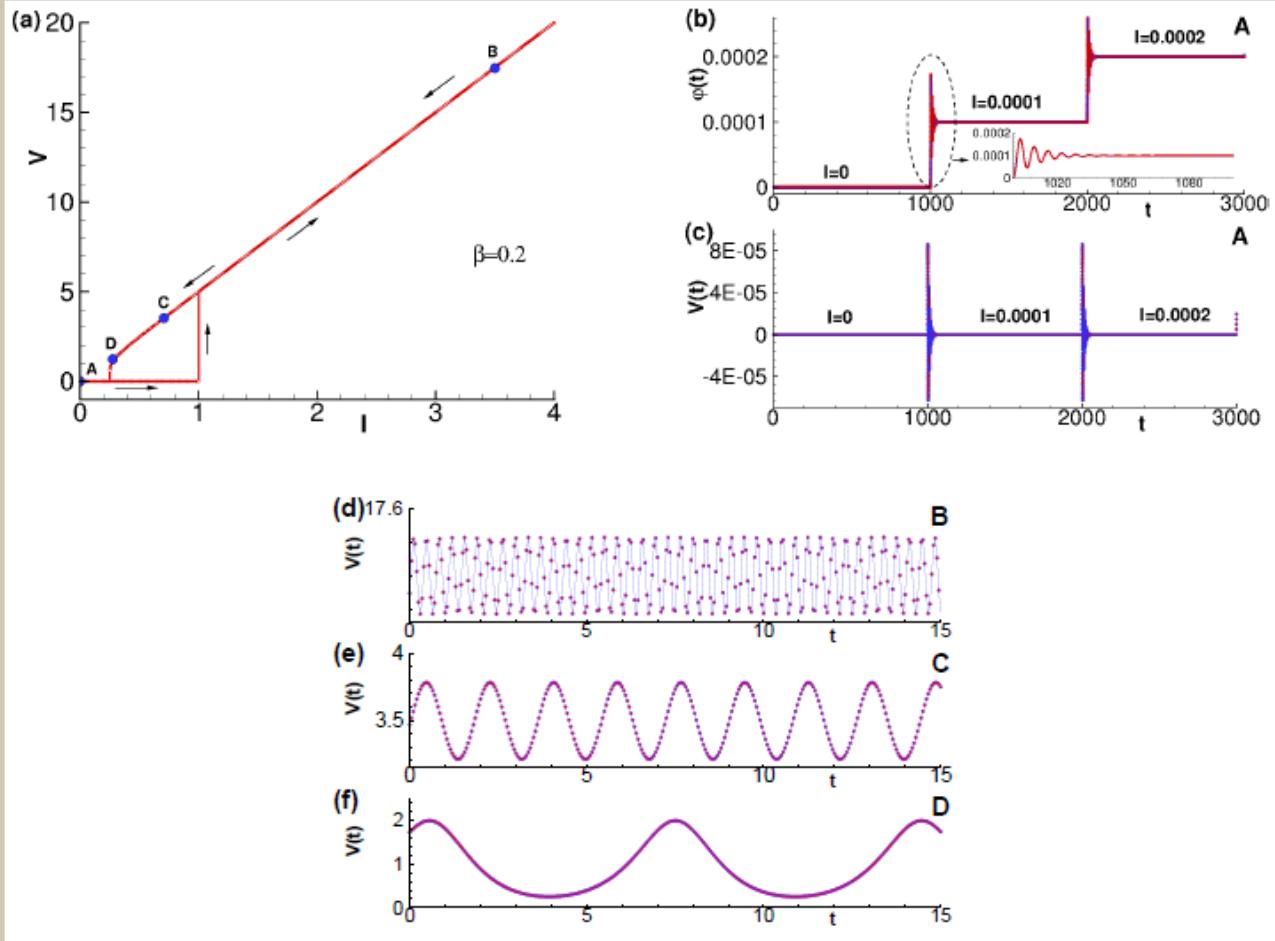

$$Q_0 = \epsilon \epsilon_0 V_0 / r_D^2$$

# Mechanism for the $\varphi_0$ - Josephson junction realization.

Very special situation is possible when the weak link in Josephson junction is a non-centrosymmetric magnetic metal with broken inversion symmetry !

Suitable candidates : MnSi, FeGe  
or thin ferromagnetic films on the substrate.

Josephson junctions with time reversal symmetry:  $j(-\varphi) = -j(\varphi)$ ;  
i.e. higher harmonics can be observed  $\sim j_n \sin(n\varphi)$  –the case of the  $\pi$  junctions.

Without this restriction a more general dependence is possible

$$j(\varphi) = j_0 \sin(\varphi - \varphi_0).$$

**Rashba-type** spin-orbit coupling

$$\alpha(\vec{\sigma} \times \vec{p}) \cdot \vec{n}$$

$\vec{n}$  is the unit vector along the asymmetric potential gradient.

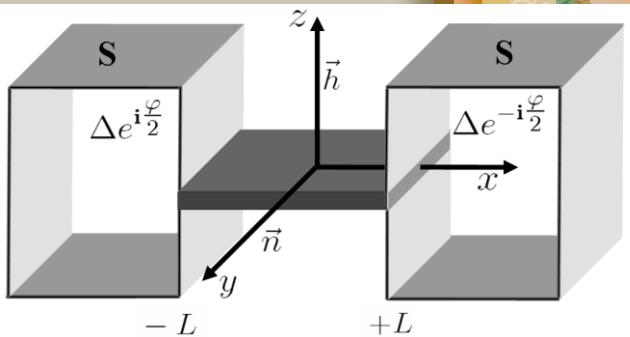

A. Buzdin, PRL, 101,107005 (2008)

# Phi-0 Josephson Junctions

$$F = a|\psi|^2 + \gamma |\vec{D}\psi|^2 + \frac{b}{2}|\psi|^4 - \varepsilon \vec{n} \cdot \{\vec{h} \times [\psi(\vec{D}\psi)^* + \psi^*(\vec{D}\psi)]\}$$

$$D_i = -i\partial_i - 2eA_i$$

$$a\psi - \gamma \frac{d^2\psi}{dt^2} + 2i\varepsilon h \frac{d\psi}{dt} = 0$$

$$\psi = A \exp(q_1 x) + B \exp(q_2 x)$$

$$j = 4e\gamma|\Delta|^2 \sqrt{\frac{a}{\gamma} - \varepsilon^2} \sin(\varphi + 2\varepsilon L) \exp\left(-2 \sqrt{\frac{a}{\gamma} - \varepsilon^2} L\right)$$

$$j(\varphi) = j_c \sin(\varphi + \varphi_0)$$

$$E_J \sim -j_c \cos(\varphi + \varphi_0)$$

A. Buzdin, PRL, 101, 107005 (2008)

# Energy of the system:

$$E_{tot} = -\frac{\phi_0}{2\pi} \varphi I + E_s(\varphi, \varphi_0) + E_M(\varphi_0)$$

$$E_S(\varphi, \varphi_0) = E_J[1 - \cos(\varphi - \varphi_0)]$$

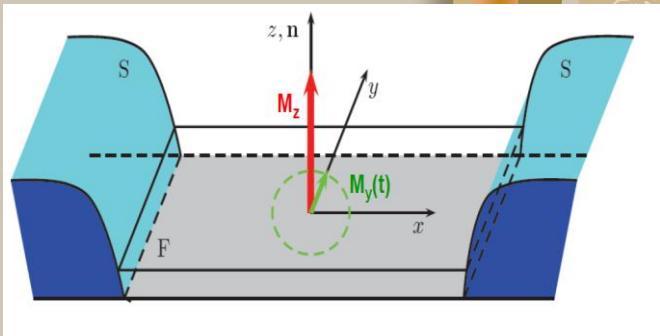

$$E_M = \frac{-KV}{2} \left( \frac{M_z}{M_0} \right)^2 \quad E_J = \frac{\phi_0 I_c}{2\pi} \quad \varphi_0 = l \frac{v_0 M_y}{v_F M_0},$$

Landau-Lifshitz-Gilbert equation:

$$\frac{dM}{dt} = -\gamma [M \times H_{eff}] + \frac{\alpha}{M_0} [M \times \frac{dM}{dt}]$$

$$H_{eff} = \frac{K}{M_0} \left[ \Gamma \sin \left( \varphi - r \frac{M_y}{M_0} \right) \vec{y} + \frac{M_z}{M_0} \vec{z} \right]$$

$$\Gamma = Gr = \frac{E_J}{KV} l \frac{v_0}{v_F}, \quad G = \frac{E_J}{KV}, \quad r = l \frac{v_0}{v_F}, \quad l = 4 \frac{hL}{\hbar v_F}$$

# System of equations for magnetization dynamics

$$\begin{cases} \dot{m}_x = \frac{1}{1+\alpha^2} \{-m_y m_z + Gr m_z \sin(\omega t - rm_y) - \alpha [m_x m_z^2 + Gr m_x m_y \sin(\omega t - rm_y)]\} \\ \dot{m}_y = \frac{1}{1+\alpha^2} \{m_x m_z - \alpha [m_y m_z^2 - Gr(m_z^2 + m_x^2) \sin(\omega t - rm_y)]\} \\ \dot{m}_z = \frac{1}{1+\alpha^2} \{-Gr m_x \sin(\omega t - rm_y) - \alpha [Gr m_y m_z \sin(\omega t - rm_y) - m_z (m_x^2 + m_y^2)]\} \end{cases}$$

Naturally, we may expect that the most interesting situation corresponds to the case when the magnetic anisotropy energy does not exceed too much the Josephson energy. From the measurements [18] on permalloy with very weak anisotropy, we may estimate  $K \sim 4 \times 10^{-5} \text{ K} \cdot \text{\AA}^{-3}$ . On the other hand, typical value of  $L$  in S/F/S junction is  $L \sim 10 \text{ nm}$  and  $\sin \ell / \ell \sim 1$ . Then, the ratio of the Josephson over magnetic energy would be  $E_J/E_M \sim 100$  for  $T_c \sim 10 \text{ K}$ . Naturally, in the more realistic case of stronger anisotropy, this ratio would be smaller, but it is plausible to expect a great variety of regimes from  $E_J/E_M \ll 1$  to  $E_J/E_M \gg 1$ .

# Phi-0 Josephson Junction: Analytical Results I

- Magnetic moment precession around z-axis

$$\begin{cases} \dot{m}_x = \frac{1}{1+\alpha^2} \{-m_y m_z + Gr m_z \sin(\omega t - rm_y) - \alpha[m_x m_z^2 + Gr m_x m_y \sin(\omega t - rm_y)]\} \\ \dot{m}_y = \frac{1}{1+\alpha^2} \{m_x m_z - \alpha[m_y m_z^2 - Gr(m_z^2 + m_x^2) \sin(\omega t - rm_y)]\} \\ \dot{m}_z = \frac{1}{1+\alpha^2} \{-Gr m_x \sin(\omega t - rm_y) - \alpha[Gr m_y m_z \sin(\omega t - rm_y) - m_z(m_x^2 + m_y^2)]\} \end{cases}$$

At  $G \ll 1$ ,  $(m_x, m_y) \ll 1$

$$\begin{cases} \dot{m}_x = -m_y + Gr \sin(\omega t) \\ \dot{m}_y = m_x \end{cases}$$

$$m_x = \frac{Gr \omega \cos \omega t}{1 - \omega^2} \quad \text{and} \quad m_y = \frac{Gr \sin \omega t}{1 - \omega^2}$$

- Second harmonic :  
its monitoring would reveal the dynamics of magnetic system

$$\begin{aligned} \frac{I}{I_c} &= \sin(\omega t - rm_y) = \sin(\omega t - r \frac{Gr \sin \omega t}{1 - \omega^2}) = \\ &\quad \sin \omega t + \frac{Gr^2}{2} \frac{1}{\omega^2 - 1} \sin 2\omega t + \dots \end{aligned}$$

## Phi-0 Josephson Junction: Analytical Results II

$$\begin{cases} \dot{m}_x = \frac{1}{1+\alpha^2} \{-m_y m_z + Gr m_z \sin(\omega t - rm_y) - \alpha[m_x m_z^2 + Gr m_x m_y \sin(\omega t - rm_y)]\} \\ \dot{m}_y = \frac{1}{1+\alpha^2} \{m_x m_z - \alpha[m_y m_z^2 - Gr(m_z^2 + m_x^2) \sin(\omega t - rm_y)]\} \\ \dot{m}_z = \frac{1}{1+\alpha^2} \{-Gr m_x \sin(\omega t - rm_y) - \alpha[Gr m_y m_z \sin(\omega t - rm_y) - m_z(m_x^2 + m_y^2)]\} \end{cases}$$

- Effect of damping: a damped resonance at  $\omega \rightarrow 1$

$$\begin{cases} \dot{m}_x = \frac{1}{1+\alpha^2} \{-m_y + Gr \sin \omega t - \alpha m_x\} \\ \dot{m}_y = \frac{1}{1+\alpha^2} \{m_x - \alpha[m_y - Gr \sin \omega t]\} \end{cases} \quad m_y(t) = \frac{\omega_+ - \omega_-}{r} \sin \omega t - \frac{\alpha_+ + \alpha_-}{r} \cos \omega t$$

$$\omega_{\pm} = \frac{Gr^2}{2} \frac{\omega \pm 1}{\Omega_{\pm}} \quad \text{and} \quad \alpha_{\pm} = \frac{Gr^2}{2} \frac{\alpha \omega}{\Omega_{\pm}} \quad \Omega_{\pm} = (\omega \pm 1)^2 + \alpha^2 \omega^2$$

- Effect of damping: a dc contribution to the Josephson current

$$I(t) \approx I_c \sin \omega t + I_c \frac{\omega_+ - \omega_-}{2} \sin 2\omega t - I_c \frac{\alpha_+ + \alpha_-}{2} \cos 2\omega t + I_0(\alpha)$$

$$I_0(\alpha) = \frac{\alpha Gr^2 \omega}{4} \left( \frac{1}{\Omega_-} + \frac{1}{\Omega_+} \right)$$

# Generation of magnetic precession at fixed Josephson frequency

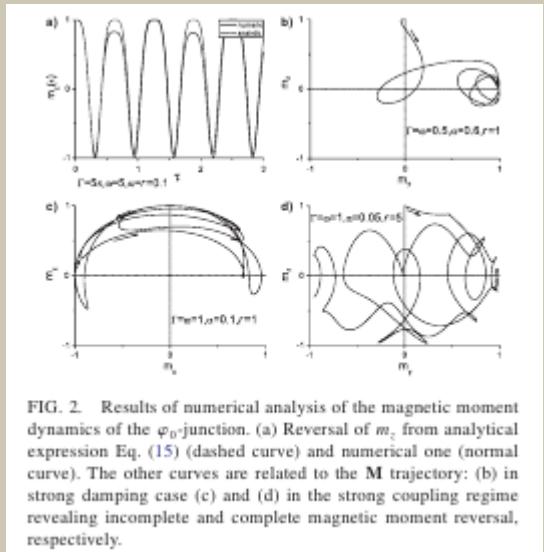

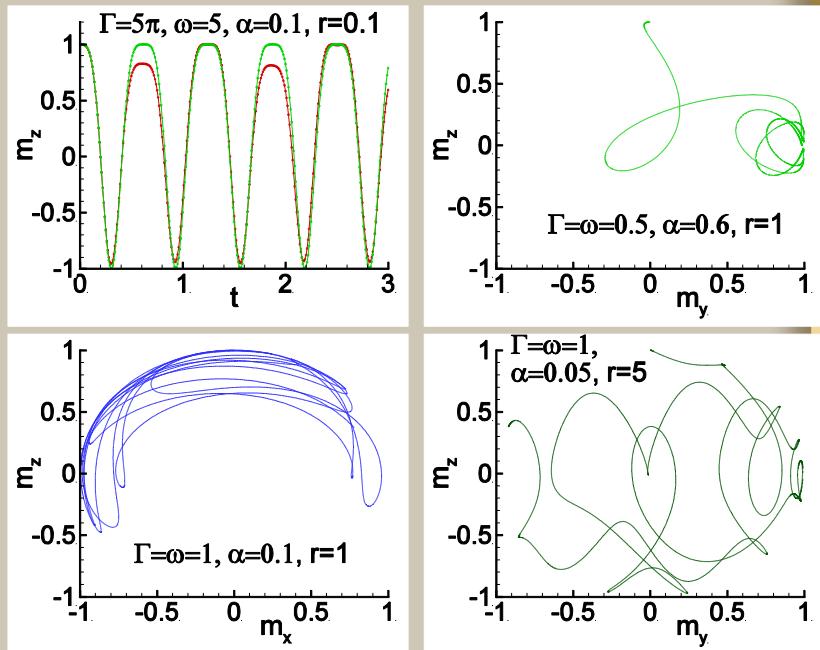

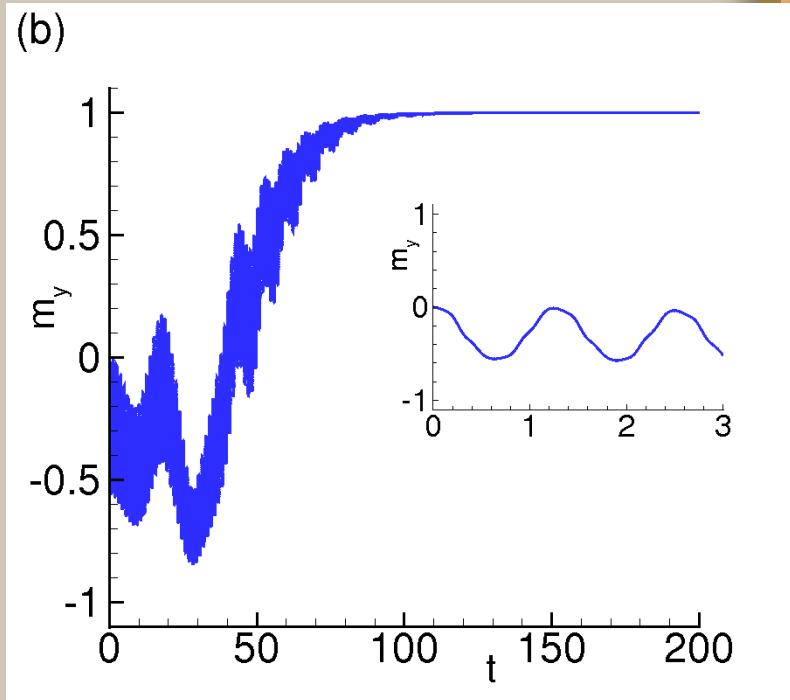

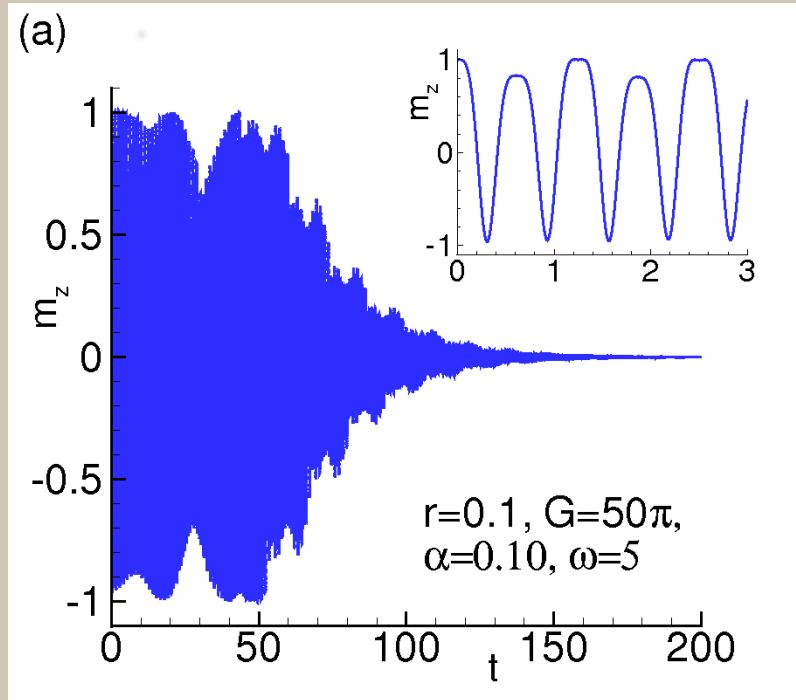

FIG. 2. Results of numerical analysis of the magnetic moment dynamics of the  $\varphi_0$ -junction. (a) Reversal of  $m_z$  from analytical expression Eq. (15) (dashed curve) and numerical one (normal curve). The other curves are related to the M trajectory: (b) in strong damping case (c) and (d) in the strong coupling regime revealing incomplete and complete magnetic moment reversal, respectively.

# The frequency - G-diagram for averaged $m_y$ shown by color.

An increase in G makes orientation of  $m_y$  along y-axis stable, but that the frequency dependence differs from characteristic Kapitza pendulum behavior.

# Kapitza method

The system of equations, describing the dynamics of the magnetic moment in the angular variables  $m_z = \cos \theta$ ,  $m_x = \sin \theta \cos \phi$ ,  $m_y = \sin \theta \sin \phi$ , can be written as

$$\begin{cases} \dot{\phi} = \frac{\cos \theta}{1+\alpha^2} - \\ \frac{Gr}{1+\alpha^2} \frac{1}{\sin \theta} [\cos \theta \sin \phi - \alpha \cos \phi] \sin [\omega \tau - r \sin \theta \sin \phi], \\ \dot{\theta} = -\frac{\alpha \sin 2\theta}{2(1+\alpha^2)} + \\ \frac{Gr}{1+\alpha^2} [\alpha \cos \theta \sin \phi + \cos \phi] \sin [\omega \tau - r \sin \theta \sin \phi]. \end{cases}$$

Let us make the replacements

$$\begin{aligned} \theta &\rightarrow \Theta + \xi, \\ \phi &\rightarrow \Phi + \eta. \end{aligned}$$

Here  $\Theta$  and  $\Phi$  describe slow movement, while  $\xi$  and  $\eta$  are coordinates for fast-varying movement. Conditions for  $\xi$  and  $\eta$  are discussed in the Supplement. We consider  $\bar{\theta} = \Theta$ ,  $\bar{\phi} = \Phi$ , where averaging is taken over the period of the fast-varying force  $T = \frac{2\pi}{\omega}$ .

# Kapitza method

The system of equations for slow movement has a form

$$\begin{cases} \dot{\Phi} = \frac{\cos \Theta}{1+\alpha^2} - \frac{(Gr)^2 r \alpha}{2\omega(1+\alpha^2)^2} \cdot \frac{1}{\sin \Theta} [\cos \Theta \sin \Phi \\ \quad - \alpha \cos \Phi] \{1 - \sin^2 \Theta \sin^2 \Phi\}, \\ \dot{\Theta} = -\frac{\alpha \sin 2\Theta}{2(1+\alpha^2)} + \frac{(Gr)^2 r \alpha}{2\omega(1+\alpha^2)^2} [\alpha \cos \Theta \sin \Phi \\ \quad + \cos \Phi] \{1 - \sin^2 \Theta \sin^2 \Phi\} \end{cases}$$

There are some equilibrium points of the system following from  $\dot{\Theta} = 0, \dot{\Phi} = 0$ .

The first pair is located on the equator

$$\Theta_0 = \pi/2, \Phi_0 = \pi/2 \text{ and } \Theta_0 = \pi/2, \Phi_0 = 3\pi/2$$

Yu. M. Shukrinov, A. Mazanik, I. R. Rahmonov, A. E. Botha and A. Buzdin.

Re-orientation of easy axis in Phi-0-junction,  
Europhysics Letters, EPL, 122 (2018) 37001

# Kapitza method

Linearization of after substitution  $\Phi = \Phi_0 + \delta\phi$ ,  $\Theta = \Theta_0 + \delta\theta$  gives

$$\begin{cases} \dot{\delta\phi} = \frac{1}{1+\alpha^2}\delta\theta, \\ \dot{\delta\theta} = \frac{\alpha}{1+\alpha^2}\delta\theta. \end{cases} \quad (1)$$

It's clear that  $\delta\theta \sim e^{\frac{\alpha\tau}{1+\alpha^2}}$ , so these points are unstable.

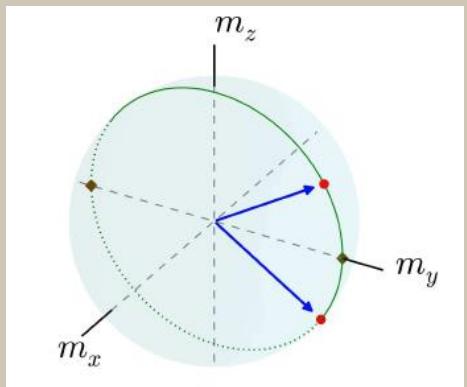

We find that the equilibrium points at  $\Phi_0 = \frac{\pi}{2}$  are described by equation

$$\sin \Theta_0 = \frac{-1 + \sqrt{1 + 4\beta^2}}{2\beta}, \quad (2)$$

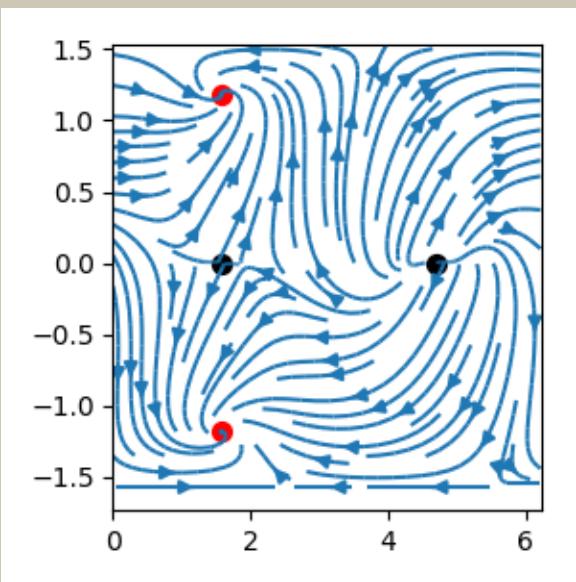

where  $\beta = \frac{(Gr)^2 r \alpha}{2\omega(1+\alpha^2)}$ , which can be approximated as  $\sin \Theta_0 = \beta$  at small  $\beta$ . It has two solutions in the interval  $0 \leq \Theta_0 \leq \pi$ .

Note that at  $\Phi_0 = \frac{3\pi}{2}$  we have  $\sin \Theta_0 = \frac{1 - \sqrt{1+4\beta^2}}{2\beta}$  which leads to the negative  $\sin \Theta_0$ , but  $\Theta$  is always positive. So, there are not any stable points at  $\Phi_0 = \frac{3\pi}{2}$ .

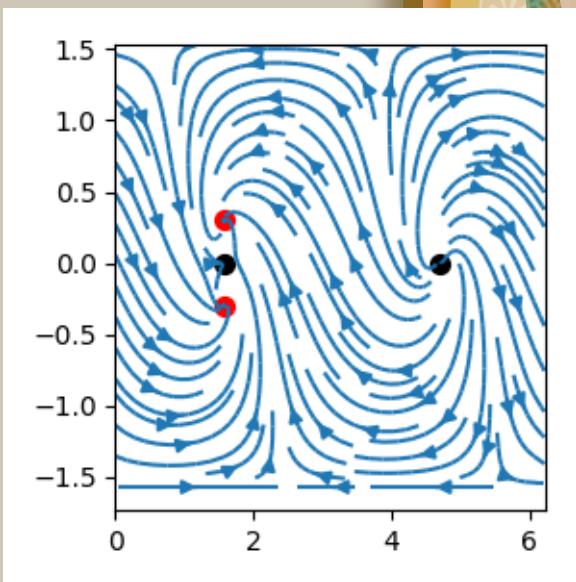

# Demonstration of equilibrium points

Arrows show stable points, other two are unstable.
