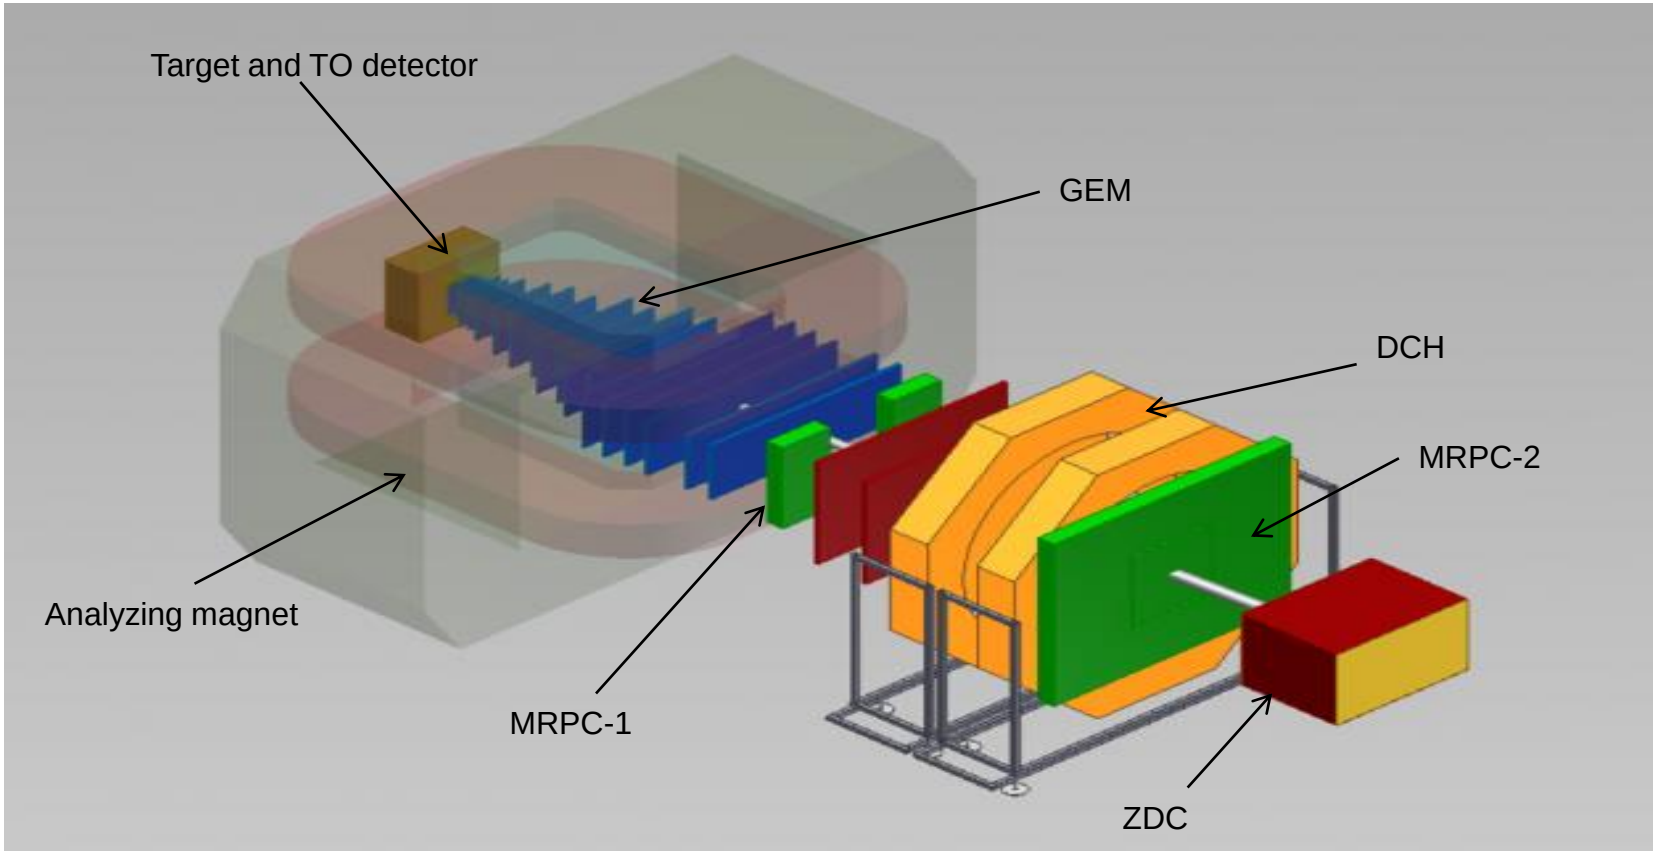
GEM central tracking detectors

Anna Maksymchuk on behalf of BM@N Collaboration

Alushta-2018

BM@N experiment

Collisions of Nuclotron heavy ion beams with fixed targets provide a unique opportunity to study strange mesons and multi-strange hyperons close to the kinematic threshold. One of the main goals of the experiment is to measure yields of light hyper-nuclei, which are expected to be produced in coalescence of Λ-hyperons with nucleons.



Basic requirements for the BM@N tracking system

Tracking system of the BM@N experiment will provide precise momentum measurements of the cascade decays products of multi-strange hyperons and hyper-nuclei produced in central Au-Au collisions. All physics measurements will be performed in conditions of high beam intensities in collisions with large multiplicity of charged particles. This requires the use of detectors with the capacity to resolve multi tracks produced at very high rate.

The basic requirements for the tracking system are:

- capability of stable operation in conditions of high loadings up to 10^5 Hz/cm^2;
- high spatial and momentum resolution;
-high geometrical efficiency (better than 95%);
-maximum possible geometrical acceptance within the BM@N experiment dimensions;
- tracking system detectors must function in a 0.8 T magnetic field.

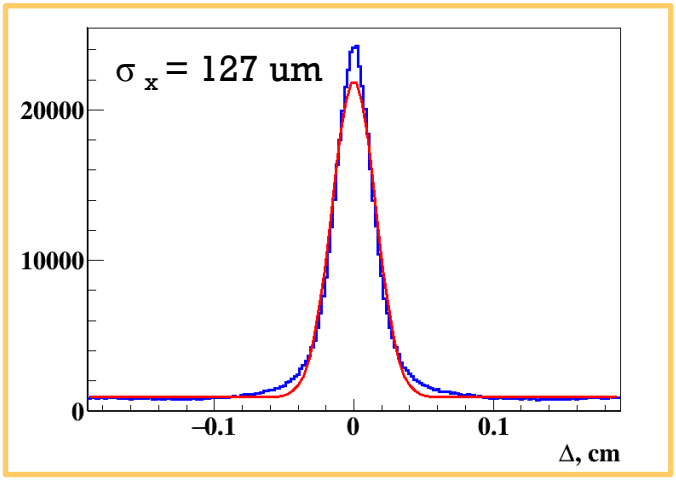
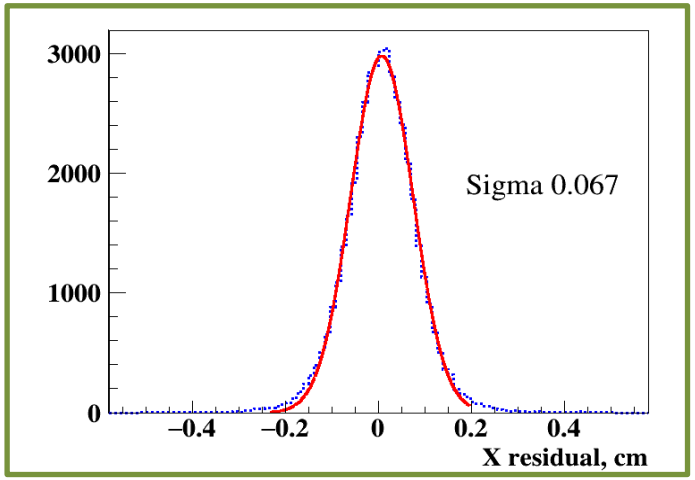
The average trajectories of the deuteron beam and the average Lorentz shifts of an electron avalanche in 6 GEM planes measured for four values of the magnetic field.

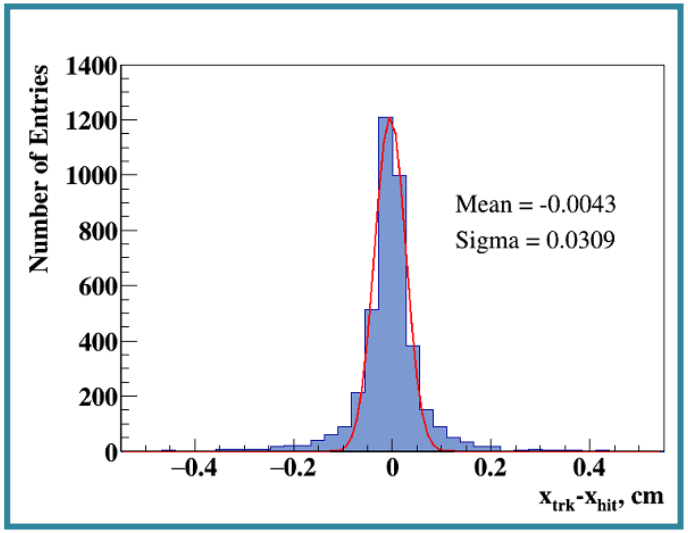
GEM tests at Nuclotron d and C beams



GEM hit residuals, w/o magnetic field, Ar(90)/IsoButane(10), deuteron beam



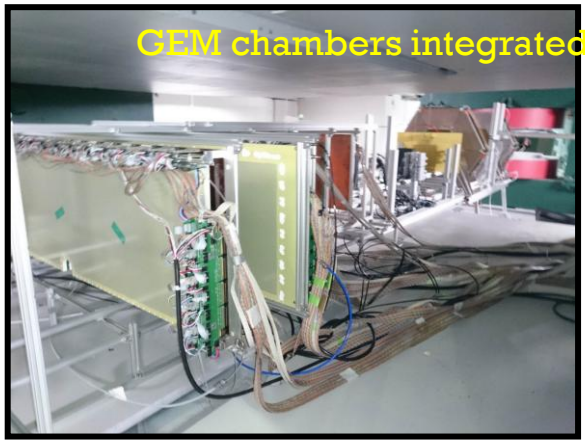
GEM hit residuals, magnetic field 0.79 T, Ar(90)/IsoButane(10), deuteron beam



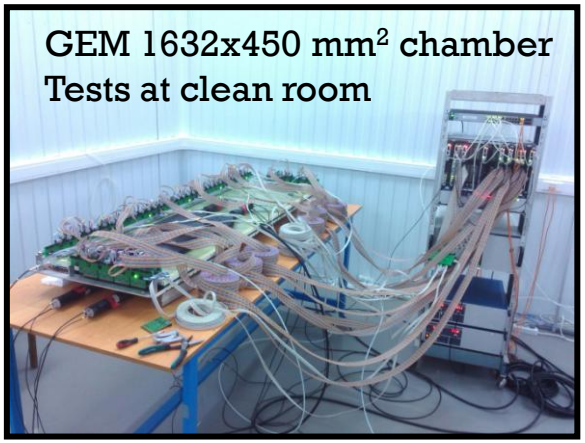
GEM hit residuals, magnetic field 0.59 T, Ar(70)/CO2(30), carbon beam

Conclusions

Triple GEM detectors of the BM@N tracker system have been assembled and studied in the d, C, Ar, Kr beams of the Nuclotron accelerator. The measured parameters of the GEM detectors are consistent with the design specifications. Seven GEM chambers with the size of 1632 mm × 450 mm are the biggest GEM detectors produced in the world for today.



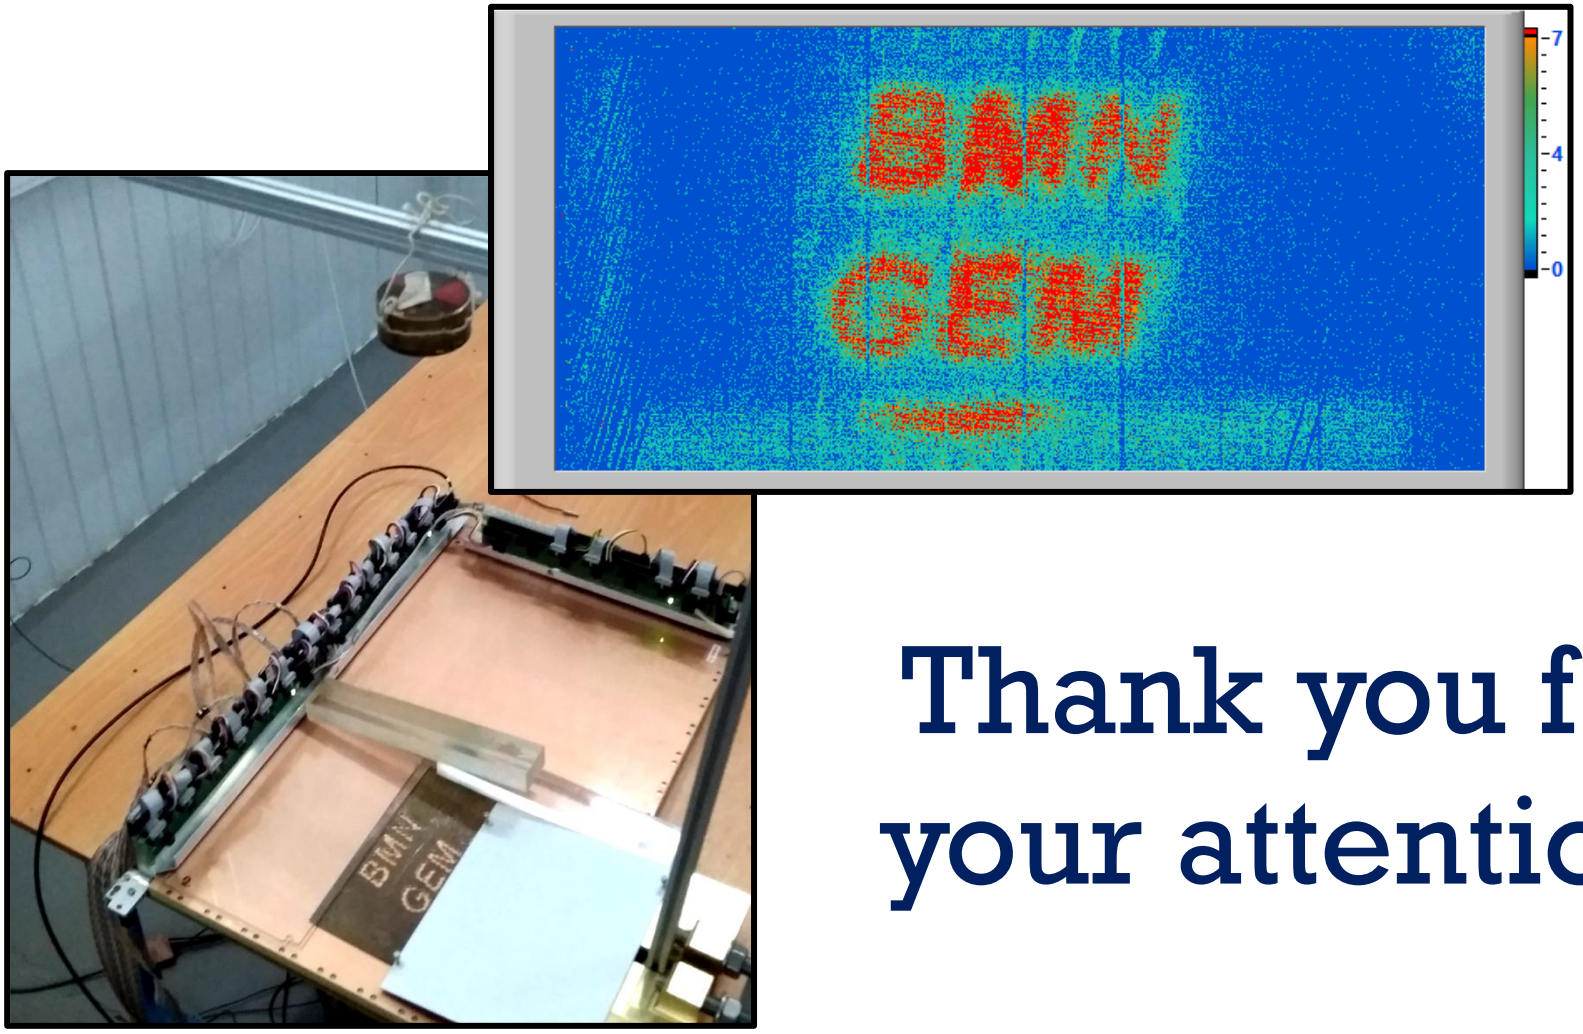
GEM chambers integrated into BM@N experimental setup



GEM 1632x450 mm^2 chamber
Tests at clean room

For today GEM tracking system is:

- 12 chambers 660x412 mm^2 (5) and 1632x450 mm^2 (7),
- ~ 6.5 m^2 active area,
- ~ 1 billion of independent amplification channels,
- ~ 45000 strips/electronics channels,
- > 3 km of control and readout cables.



Thank you for your attention!
