The grid-characteristic method for appled dynamic problems

July 5-9, 2021, Dubna, Russia

The International Conference "Distributed Computing and Grid-technologies in Science and **Education**" (GRID 2021)

Golubev Vasily, Senior Researcher, Laboratory of Applied Numerical Geophysics, Moscow Institute of Physics and Technology

Hyperbolic Problems = Waves

Seismic Survey Process (Direct and Inverse Problems)

Seismic Activity Simulation (Earthquakes, Tsunami)

Non-Destructing Control (Novel Composite Materials)

Ultrasound Diagnostic of Diseases

Hyperbolic System. Isotropic Case

$$\begin{cases} \rho \frac{\partial V_x}{\partial t} = \frac{\partial T_{xx}}{\partial x} + \frac{\partial T_{xy}}{\partial y} + \frac{\partial T_{xz}}{\partial z}, \\ \rho \frac{\partial V_y}{\partial t} = \frac{\partial T_{yx}}{\partial x} + \frac{\partial T_{yy}}{\partial y} + \frac{\partial T_{yz}}{\partial z}, \\ \rho \frac{\partial V_z}{\partial t} = \frac{\partial T_{zx}}{\partial x} + \frac{\partial T_{zy}}{\partial y} + \frac{\partial T_{zz}}{\partial z}, \\ \frac{\partial T_{xx}}{\partial t} = (\lambda + 2\mu) \frac{\partial V_x}{\partial x} + \lambda (\frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z}), \\ \frac{\partial T_{yy}}{\partial t} = (\lambda + 2\mu) \frac{\partial V_y}{\partial y} + \lambda (\frac{\partial V_x}{\partial x} + \frac{\partial V_z}{\partial z}), \\ \frac{\partial T_{zz}}{\partial t} = (\lambda + 2\mu) \frac{\partial V_z}{\partial z} + \lambda (\frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y}), \\ \frac{\partial T_{xy}}{\partial t} = \mu (\frac{\partial V_x}{\partial y} + \frac{\partial V_y}{\partial x}), \\ \frac{\partial T_{xz}}{\partial t} = \mu (\frac{\partial V_x}{\partial z} + \frac{\partial V_z}{\partial x}), \\ \frac{\partial T_{yz}}{\partial t} = \mu (\frac{\partial V_y}{\partial z} + \frac{\partial V_z}{\partial y}). \end{cases}$$

Elastic Parameters: ρ – density, λ , μ – Lame parameters; **Unknowns:** V – velocity; T – stress tensor

Numerical Grid-Characteristic Method

Hyperbolic System $\mathbf{A} = \mathbf{\Omega}^{-1} \mathbf{\Lambda} \mathbf{\Omega}$

$$\begin{aligned} \frac{\partial \vec{u}}{\partial t} &+ \Omega^{-1} \Lambda \Omega \frac{\partial \vec{u}}{\partial \xi} = 0\\ \frac{\partial \vec{v}}{\partial t} &+ \Lambda \frac{\partial \vec{v}}{\partial \xi} = 0 \quad (\vec{v} \equiv \Omega \vec{u})\\ v^{n+1}(\xi) &= v^n (\xi - \lambda \tau) \end{aligned}$$

Split Directions

 $u^{n+1} = u^n - \tau (A_1 \Delta_1 + A_2 \Delta_2 + A_3 \Delta_3) u^n + O(\tau^2)$

Research Software Developed

- Seismic waves simulation in elastic media Taking into account heterogeneities (cavities, layers,
- fractures)
- Discreet model of destruction (correction of stress) tensor)
- C++, micro-optimisations (SIMD, SSE, AVX) Parallelization with OpenMP and MPI (~ 80 % up to 16 000 cores)

Khokhlov N.I., MIPT

Wide Range of Supported Meshes

×

D 2D Rectangle Curvilinear **Triangle D** 3D Tetrahedral Hexahedral Hierarchical

HPC Systems and Scalability

□ HPC system: HECToR (Edinburgh) Up to 16 000 cores □ Efficiency ~ 80 %

Parallelization Speedup

- HECToR 80 % (up to 16k cores)
- - Tesla C2050 120x faster
 - Tesla K20c 240x faster

OpenMP:

- AMD Opteron 6272 37x faster (64 cores) AMD Opteron 8431 - 25x faster (48 cores) Intel Xeon E5-2697 - 17x faster (24 cores)

by Ivanov A.M., MIPT

Examples of Simulation

Waves in Thin Plates*

Fig. 2 presents the snapshots of displacement response of the cracked infinite plate after the S0 mode is excited by the applied tractions. At t = 0.015 ms, the initial wave packet of the S0 mode is propagating towards the crack. When it reaches the right crack tip, diffracted S0 mode and SH0 mode are generated, as well as diffracted Rayleigh-type waves propagating along crack surfaces at a speed slightly lower than that of the SH0 mode. When the initial S0 mode encounters the upper crack surface, reflected S0 and SH0 modes are generated. These diffracted and reflected waves can be seen clearly at t = 0.029 ms. SH0 mode waves are in-plane guided waves, so they do not have the out-of-plane displacement component and cannot be observed from the u3-displacement snapshot.

2D Geological Model

Transversely Isotropic Geological Media

1. We performed a numerical simulation of the propagation of seismic waves in the elastic Marmousi II model, into which the VTI anisotropy was added using the following relations

 $\varepsilon = 0.25\rho - 0.3, \delta = 0.125\rho - 0.1,$

where density is in g/cm³, ε and δ – Thomsen parameters. Rheological equations are

$$\begin{pmatrix} \sigma_{xx} \\ \sigma_{yy} \\ \sigma_{xy} \end{pmatrix} = \begin{pmatrix} C_{11} & C_{13} & 0 \\ C_{13} & C_{33} & 0 \\ 0 & 0 & C_{44} \end{pmatrix} \begin{pmatrix} \varepsilon_{xx} \\ \varepsilon_{yy} \\ \varepsilon_{xy} \end{pmatrix}$$

2. To cover the model with a computational mesh, a spatial step of 5 m and 3401 x 701 nodes were chosen. The time step was determined by the Courant condition and was 0.8 ms. All parameters of the anisotropic material were stored in each cell of the computational grid. The center of pressure located near the day surface was used as a disturbance.

The layering of the geological model, the presence of sharp boundaries and anisotropy determine the complex wave pattern.

Seismic Waves in Fluid-Filled Porous Media

We considered the propagation of seismic waves in a model containing three different layers. The top one was the water column and was described by the acoustic approximation. The second one was the fluidsaturated medium. It can be bottom sediments or producing formations. The Dorovsky model was used for precise simulation of its dynamic behavior. The underlying rock massive was simulated in the frame of the elastic approximation. Dorovsky system is

$$\vec{u}_{t} + \frac{1}{\rho_{s}} (\nabla \cdot \mathbf{h})^{T} + \frac{1}{\rho_{0}} \nabla p = \vec{F},$$

$$\vec{v}_{t} + \frac{1}{\rho_{0}} \nabla p = \vec{F},$$

$$p_{t} - (K - \alpha \rho_{0} \rho_{s}) (\nabla \cdot \vec{u}) + \alpha \rho_{0} \rho_{f} (\nabla \cdot \vec{v}) = 0.$$

$$\mathbf{h}_{t} + \mu \left(\nabla \otimes \vec{u} + (\nabla \otimes \vec{u})^{T} \right) + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) + \lambda \rho_{0} \nabla \cdot \vec{u} \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right) (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] (\nabla \cdot \vec{u}) \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] \right] + \left[\left(\lambda - \frac{\rho_{s}}{\rho_{0}} K \right] \right] + \left[\left(\lambda - \frac{\rho_$$

$$\left. \frac{\rho_f}{\rho_0} K(\nabla \cdot \vec{v}) \right] \mathbf{I} = 0,$$

Seismic Waves in Fluid-Filled Porous Media

The simulated wavefield in the computational domain for the fixed time step is presented. Modulus of fluid and skeleton velocities are depicted. Different components of the seismic signal are denoted with letters from **a** to **g**. The source point (a) produces a stationary noise and can be easily filtered out. The wave b was initiated after the interaction with the day surface. Inside the porous layer, two P-waves (e and c) and one S-wave d are propagated. The last one demonstrates an obvious zero amplitude value right below the source point. The interaction of the P-wave (e) with the elastic layer leads to the occurrence of P (f) and S (i) transmitted waves and two reflected waves (h and g).
