## Massless 6D infinite spin fields

*Tuesday, 11 October 2022 17:10 (25 minutes)* 

Massless irreducible representations of the Poincaré group in the six-dimensional Minkowski space are studied.

It is shown that the finite spin representation is defined by two integer or half-integer numbers while the infinite spin representation is defined by the real parameter and one integer or half-integer number. Massless infinite spin irreducible representations in the space of the two-twistor fields are constructed and a full set of equations of motion for such fields is found.

A field twistor transform is constructed and infinite spin fields are found in the space-time formulation with an additional spinor coordinate.

A new 6D infinite spin field theory in the light-front formulation is presented.

The found infinite-spin fields in the light-cone frame depend on two sets of the SU(2)-harmonic variables. The generators of the 6D Poincaré group and the infinite spin field action in the light-front formulation are presented.
