Study of low-lying resonance states in the break up of ¹¹Be

Tuesday, 10 November 2020 17:30 (15 minutes)

We investigate the Coulomb breakup of the ¹¹Be halo nuclei on a heavy target at intermediate (70 MeV/nucleon) energies within non-perturbative time-dependent approach. The convergence of the computational scheme is demonstrated in all considered range of the energy including the low-lying resonances \textit{n}+¹⁰Be in different partial and spin states of ¹¹Be. The obtained results are in good agreement with experimental data at 69 and 72 MeV/nucleon.
