DCM-QGSM

DCM-QGSM – Dubna Cascade + Quark-Gluon-String-Model

- **DCM**

  + binary interactions (E_{Lab} < 4.5AGeV):

    hadrons → hadrons (nucleons, deltas, mesons)

  + coalescence (light fragments and hyperfragments production)

  + prequilibrium emission of particles from excited remnants

  + Fermi break-up

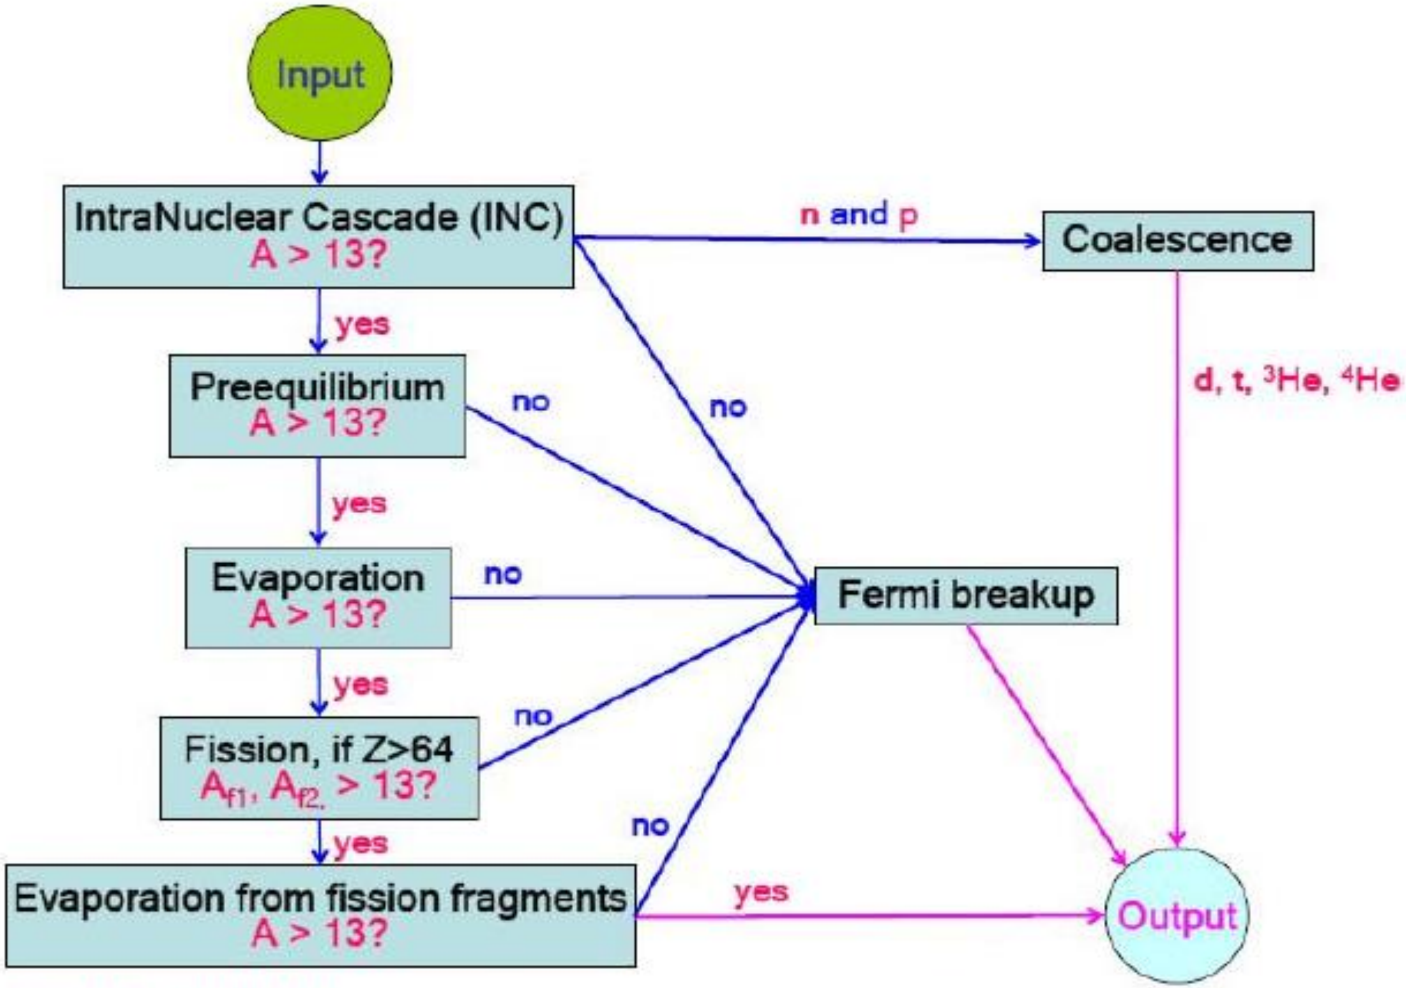
  + decay of excited remnants by evaporation or fission

- **QGSM**

  + binary interations (ELab > 4.5AGeV)

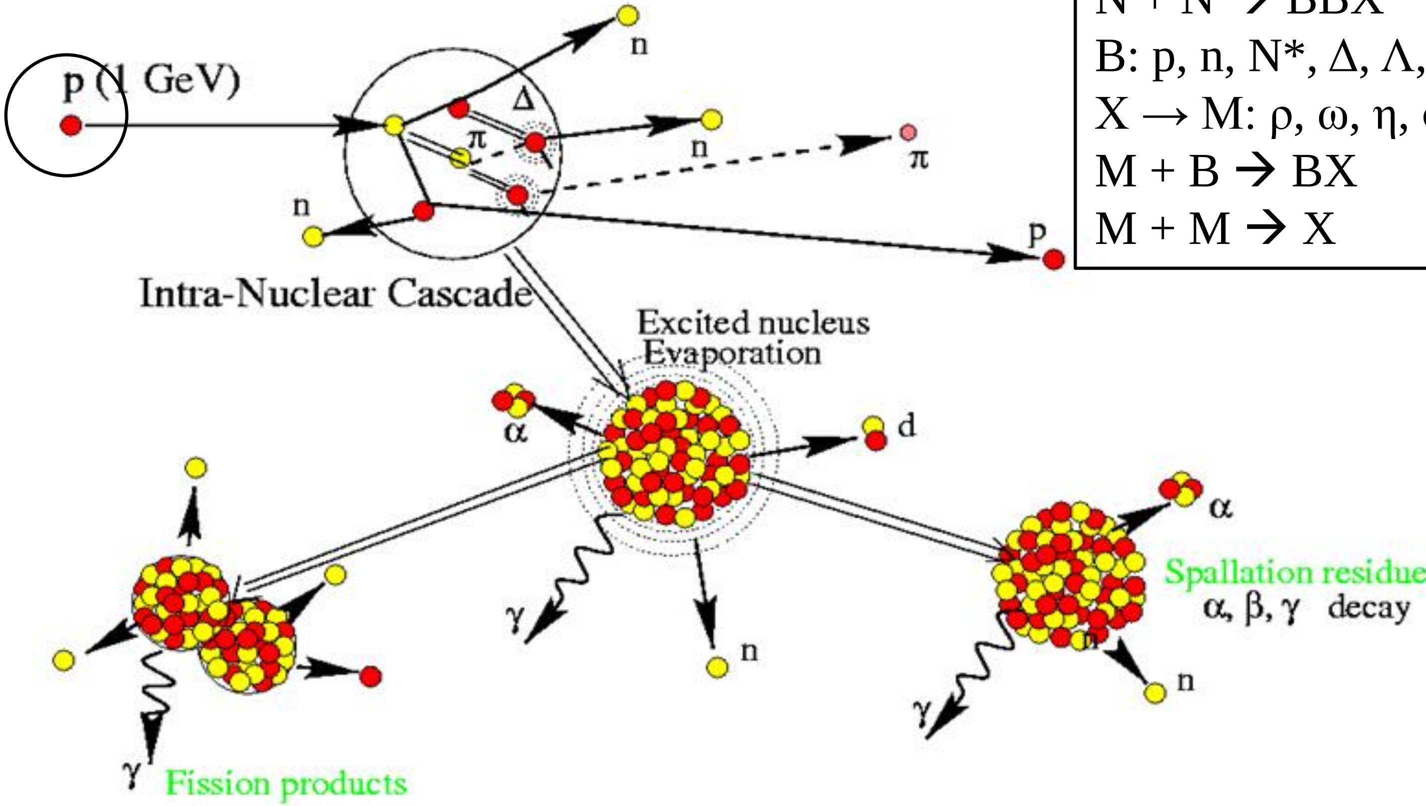
    hadrons → quark-gluon strings → hadrons

Scheme of DCM calculations



Stages in DCM-QGSM

N + N → BB
N + N → BBX
B: p, n, N*, Δ, Λ, Σ, Ξ, Ω
X → M: ρ, ω, η, φ
M + B → BX
M + M → X



DCM+QGSM

$E_{Lab} > 4.5$ AGeV

QGSM

Binary collisions

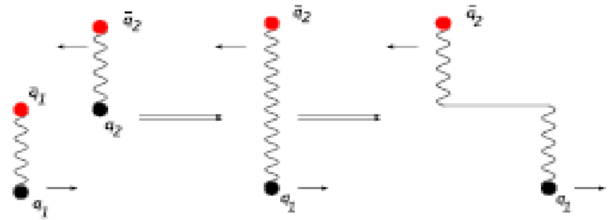
- ✓ formation quark-gluon strings between quark and di-quarks
- ✓ hadronization of strings in the framework of DPM (*A. B. Kaidalov, Sov. J. Nucl. Phys. 45 (1987) 902-907*)
- ✓ ends of strings - leading particles
- ✓ Formation time concept

QGSM

- Particularities of space-time evolution

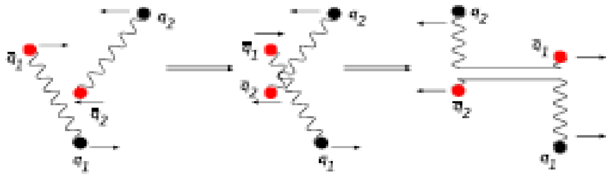
CLASSICAL STRING THEORY

⋆ string fusion



time ⇒

⋆ string rearrangement

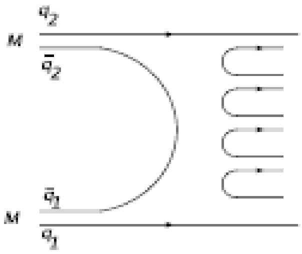


⋆ leading particle effect

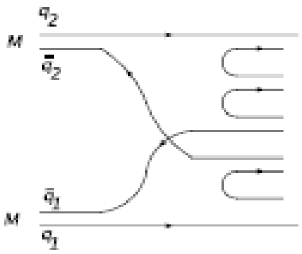
⋆ color rope formation

DUAL TOPOL. MODEL

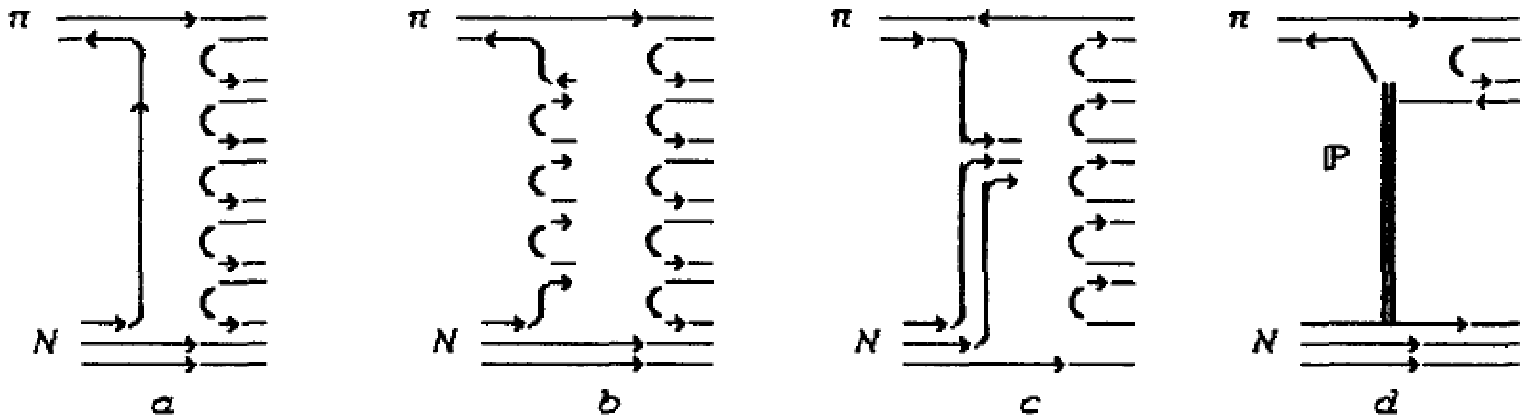
⋆ planar diagram



⋆ cylindrical diagram



QGSM



Topological diagrams for the multiparticle production in πN collisions: a - planar, b - cylindrical, c - "undeveloped" cylindrical, d - diffractive.

$$\sigma_{tot} = \sigma_{pl} + \sigma_{cyl} + \sigma_{und} + \sigma_{dif} + \sigma_{el}.$$

String extends between constituents.
String breaks by q-qbar pair according to u : d : s : qq = 1 : 1 : 0.27 : 0.1
At break -> new string + hadron

QGSM

The longitudinal momentum distribution of the constituent quark

$$u_B(x) \sim x^{-1/2}(1-x)^a,$$

$$u_M(x) \sim x^{-1/2}(1-x)^{-0.5},$$

a=1.5 for *u*-quark
a= 2.5 for *d*-quark

The transverse momentum distribution of the constituent quark

$$\omega(p_\perp) = (\pi\sigma_\perp^2)^{-1/2}\exp(-p_\perp^2/\sigma_\perp^2) \qquad \sigma_\perp = 0.51 \text{ GeV/c}$$

The fragmentation functions:

$$\begin{aligned} f_{q\to M}(z) &= 1-a+2a(1-z), \\ f_{qq\to B}(z) &= 0.4+0.6\exp[-20(1-z)]/[1+\exp(-20)], \\ f_{qq\to M}(z) &= 3a(1-z)^2, \end{aligned}$$

Particle in QGSM

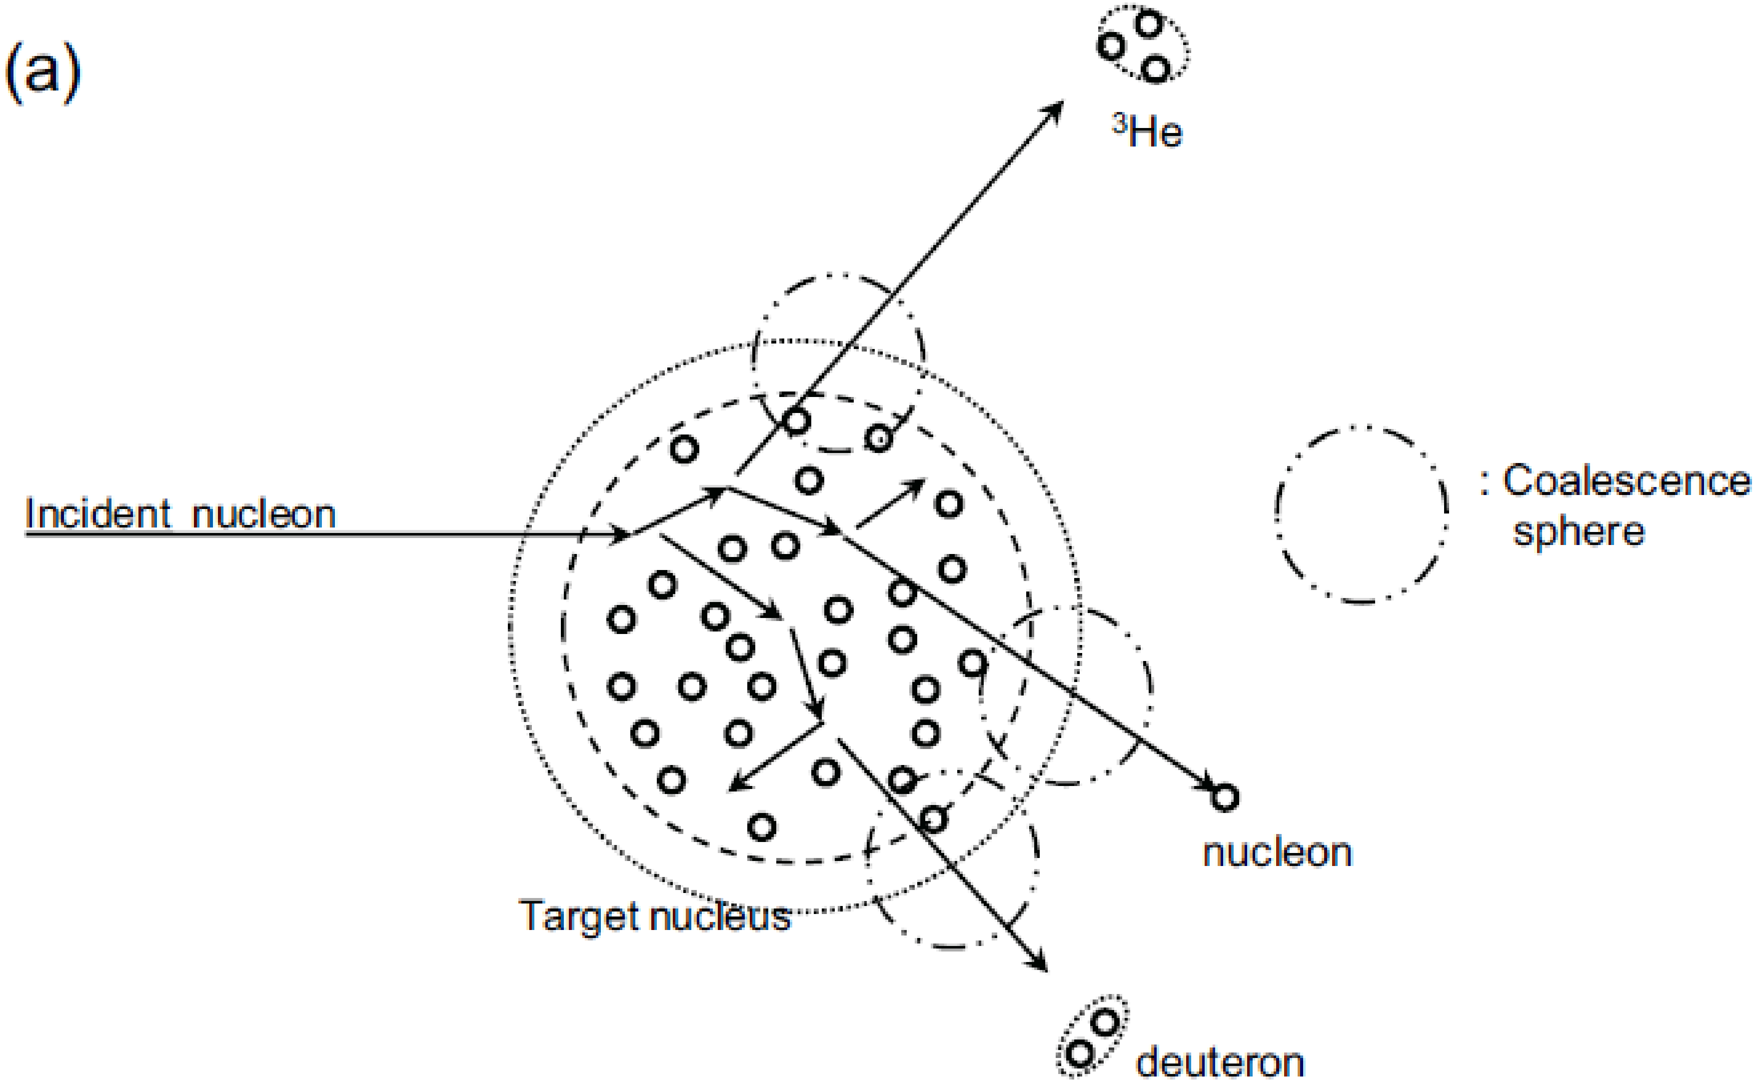
Coalescence



Schematic representation of the surface coalescence model in r -space

Coalescence

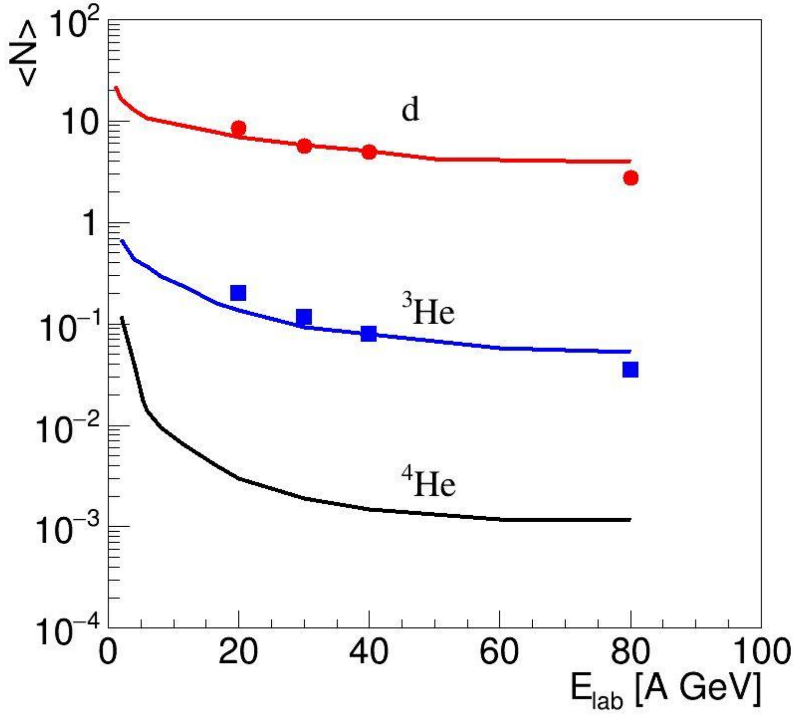
V. D. Toneev and K. K. Gudima, Nucl. Phys. A400 (1983) 173c-190c.

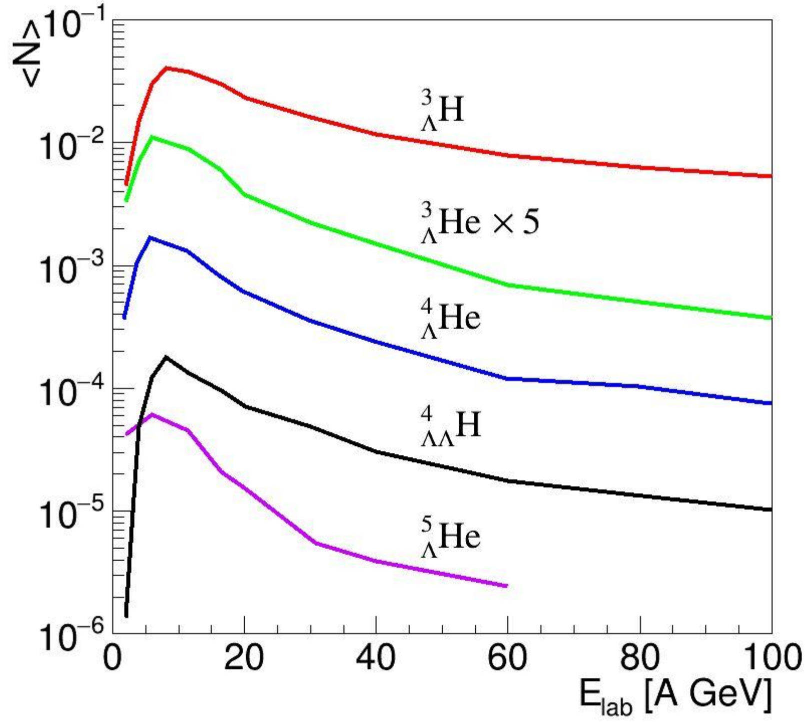
H. Schulz, G. Ropke, K. K. Gudima, and V. D. Toneev, Phys. Lett. B 124 (1983) 458-460.

- Final state interactions
- Fragments formation (d, t, ^3He, ^4He, …)
- Coalescence criteria: $(p_i - p_0) < p_c$ and $(r_i - r_0) < r_c$
- p_c = 150, 175, 175, 175 for d, t, ^3He, ^4He

Coalescence

Data are from NA49





Preequilibrium emission

- Preequilibrium particles – particles emitted after cascade stage but before equilibration of a residual nulceus.
- Initial configuration for preequilibrium decay – number of excitons n_0 (particles p_0 and holes h_0)

$$n_0 = p_0 + h_0$$

- Changing the number of excitons n_0 with $\Delta n = +2, -2$, and 0,
- Subsequent emissions of **n, p, d, t, 3He**, and **4He**.

If $A_{residual} \leq 13$ → **Fermi Break-Up**

- Input for Fermi Break-up of residual:

  $E = U + M(A, Z)$ – its total energy
  U – its excitation energy

- Break-up probability

$$W(E,n) = (V/\Omega)^{n-1}\rho_n(E)$$

where V – volume of decaying A, $\Omega = (2\pi h)^3$

$A_{residual}$ → $p, n, d, t, {}^3He, {}^3He, \ldots$

DCM-SMM: DCM-QGSM + SMM

SMM – Statistical Multifragmentation Model

A. Botvia et al, Nucl. Phys. A584 (1995) 737-756.

J.P. Bondorf, A.S. Botvina, A.S. Ilinov, I.N. Mishustin, K. Sneppen, Phys.Rep. 257 (1995) 133-221

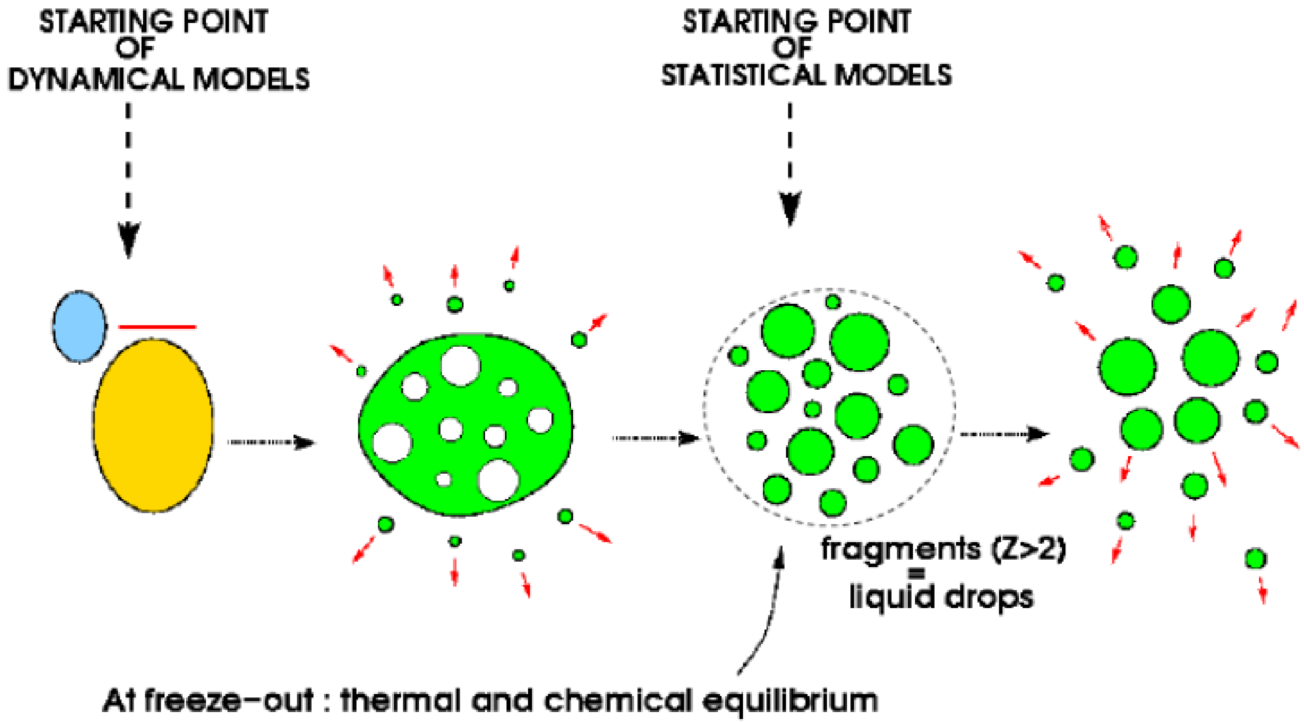
- Statistical break-up of excited nuclear residuals
- Light and medium mass fragments formation

SMM

Multifragmentation in intermediate and high energy nuclear reactions

Experimentally established:

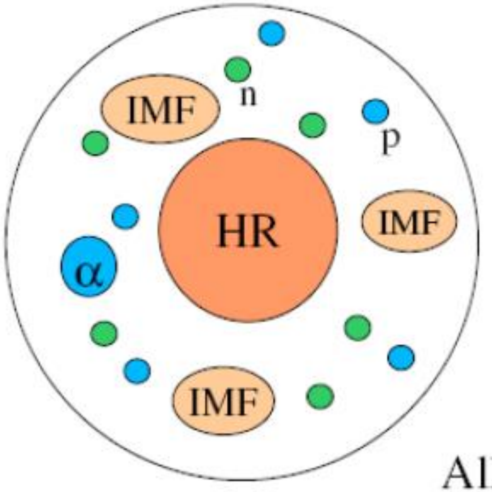
1) few stages of reactions leading to multifragmentation,
2) short time ~100fm/c for primary fragment production,
3) freeze-out density is around $0.1\rho_0$,
4) high degree of equilibration at the freeze-out,
5) primary fragments are hot.



SMM

Statistical Multifragmentation Model (SMM)

J.P.Bondorf, A.S.Botvina, A.S.Iljinov, I.N.Mishustin, K.Sneppen, Phys. Rep. **257** (1995) 133



Ensemble of nucleons and fragments in thermal equilibrium characterized by

neutron number N_0
proton number Z_0, $N_0+Z_0=A_0$
excitation energy $E^*=E_0-E_{CN}$
break-up volume $V=(1+\kappa)V_0$

All break-up channels are enumerated by the sets of fragment multiplicities or partitions, $f=\{N_{AZ}\}$

Statistical distribution of probabilities: $W_f \sim \exp\{S_f(A_0, Z_0, E^*, V)\}$
under conditions of baryon number (A), electric charge (Z) and energy (E^*) conservation, including compound nucleus.

- Kr+C, Kr+Al, Kr+Ar, Kr+Kr, Kr+Pb

DCM-SMM for SRC

C+p few million events

Determination of Number of Participants in Carbon-Nucleus Collisions

- DCM-SMM
- Glauber model
- pHSD

Number of participants

Reaction	DCM-SMM	pHSD	Glauber
CC	5.1	8.3	6.9
CAl	8.3	10.1	9.4
CCu	13.9	17.1	13.6
CPb	34.0	32.5	23.1

Further Development of DCM-SMM.

- Correction of formation time concept
- Improvement of transverse mass description
- Improvement of coalescence mechanism
- Implementation of mechanism of hyperfragment production by residuals
- Implementation of the mechanism of enhancement of strangeness
- Implementation of the mechanism of enhancement of dilepton yield

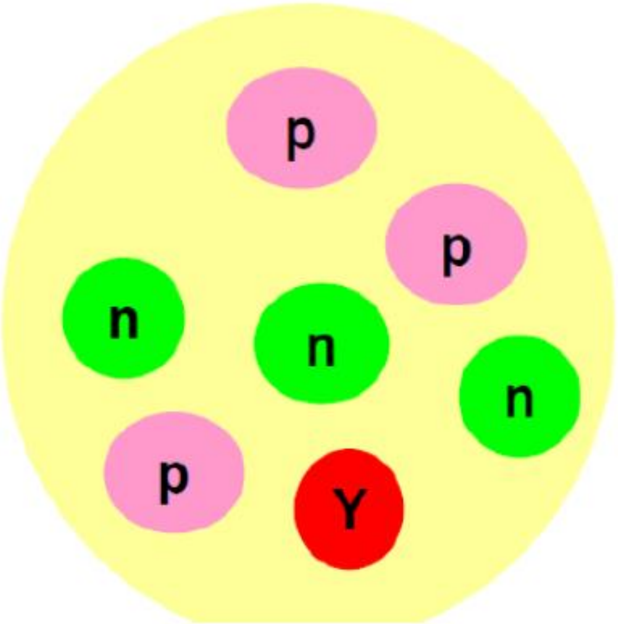
Thank you!

Backups

Hyperfragment production in DCM-SMM

Hypernucleus: Hyperons Bound in Nuclei

Hypernucleus: consists of nucleons (n, p) + hyperon (Y)



Notation:

$${}^{A}_{Y}Z$$

Y = Hyperon

$Z = Z_p + (N_Y \cdot q_Y)$

$A = N_n + N_p + N_Y$

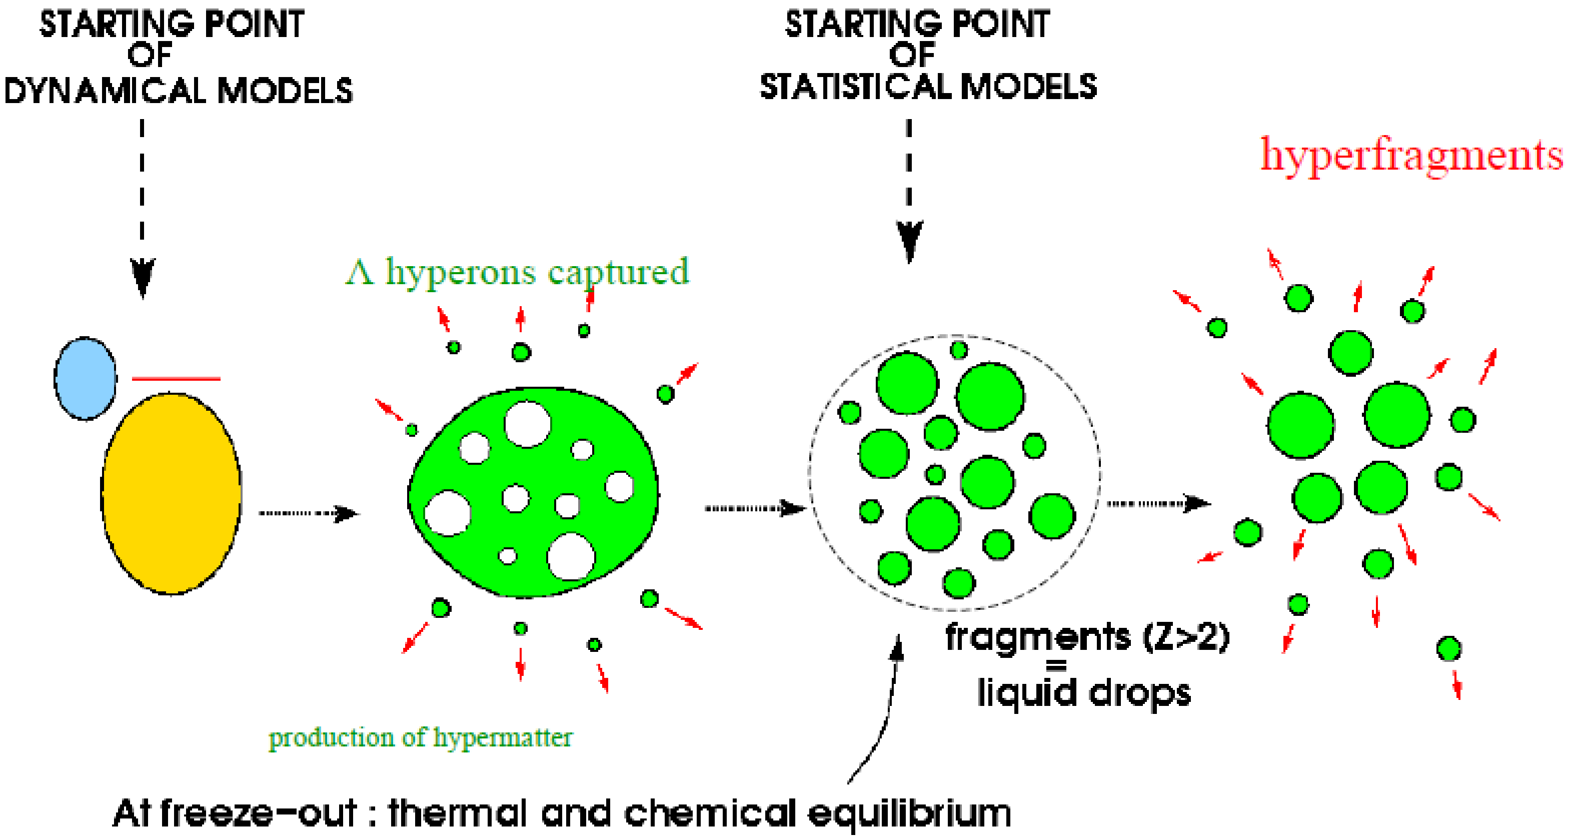
A.S.Botvina and J.Pochodzalla, Phys. Rev.C76 (2007) 024909

Generalization of the statistical de-excitation model for nuclei with Lambda hyperons

In these reactions we expect analogy with

multifragmentation in intermediate and high energy nuclear reactions

+ nuclear matter with strangeness



Hyperfragment production

A.S. Botvina, K. K. Gudima, J. Steinheimer, M. Bleicher, and I. N. Mishustin, PHYSICAL REVIEW C ***84****, 064904 (2011)*

J. Steinheimer, K.K. Gudima, A.S. Botvina, I.N. Mishustin, M. Bleicher, H. Stocker, Phys. Lett. ***B714****, 85 (2012).*

Generalized Statistical Fragmentation model

- Coalescence mechanism in central region
- Multifragmentation in forward and backward regions:

- capture of hyperons by spectator fragments in non-central heavy ion collisions

- capture criterium: $E_H < |V_\Lambda|$

$$V_\Lambda(\rho) = -\alpha \frac{\rho}{\rho_0}\left[1 - \beta\left(\frac{\rho}{\rho_0}\right)^{2/3}\right],$$
