

# CSC efficiency

- Efficiencies of CSC (recap)
- Data CSC efficiency comparison with new results
- Results of identification after Si/GEM/CSC signals normalization
- MC CSC efficiency
- Normalized CSC efficiency
- The next step

# Efficiencies of CSC (from 4<sup>th</sup> Collaboration Meeting)

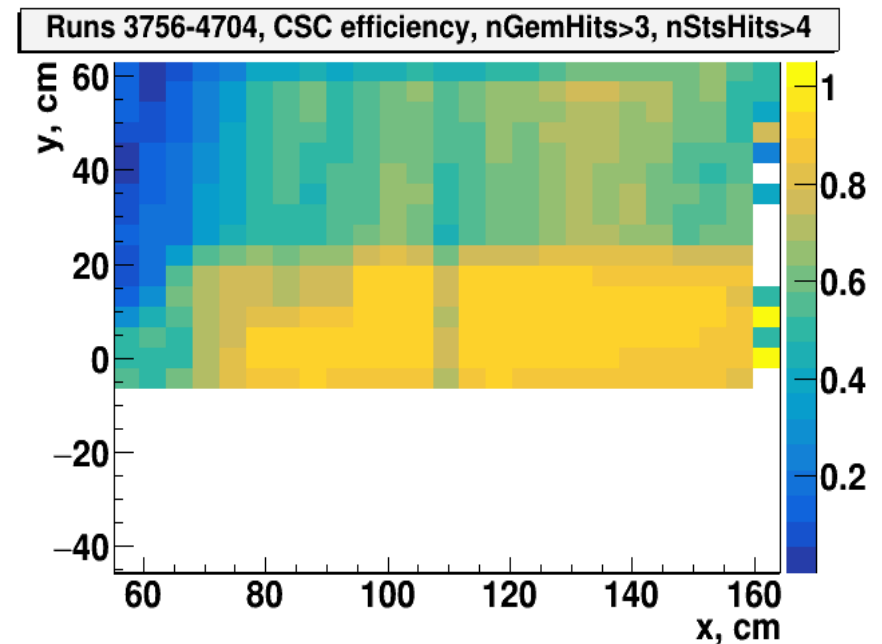

- Low efficiency at low x, large y
- There are deep drops of efficiency by runs in the main zone
- Hot zone efficiency is pretty stable

# Data CSC efficiency comparison with new results

## GEM tracking

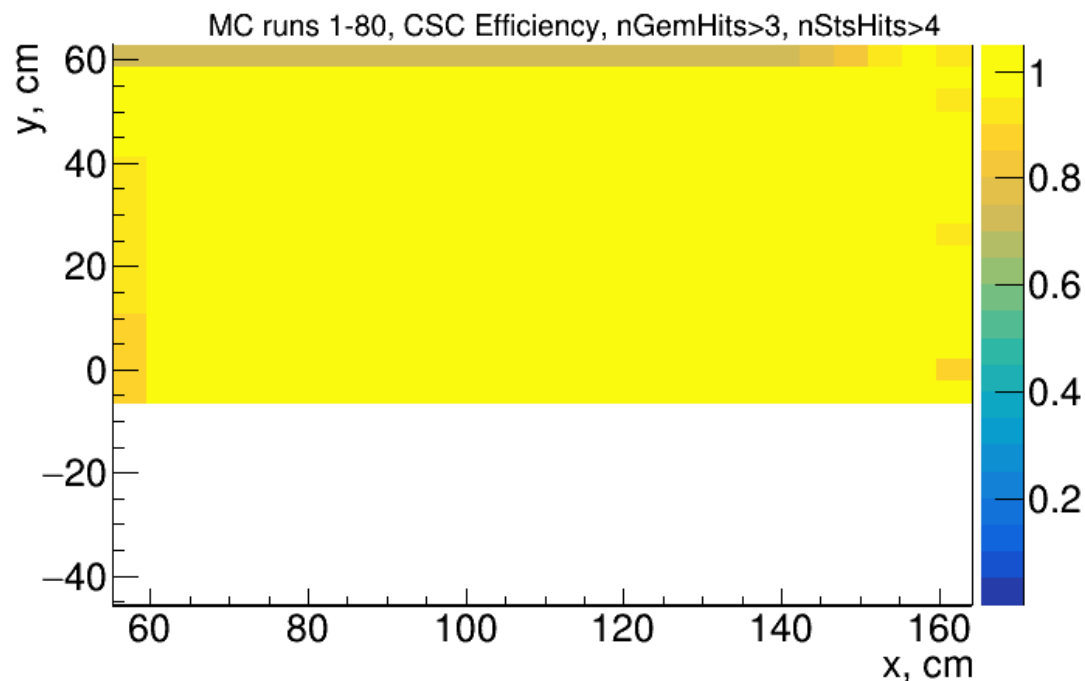

## Si/GEM extend tracking

- CSC efficiency from new result slightly less

# Results of identification after Si/GEM/CSC signals normalization

- Signals normalization made by **Lalyo**
- **Adc** spectra even for all digits Si/GEM/CSC looks similar (by station)
- Numbers of identified  $\pi^+$  and  $K^+$  are the same as without signals normalization with accuracy 0.5%
- P, Y, Pt spectra of  $\pi^+$  and  $K^+$  looks the same as without signals normalization

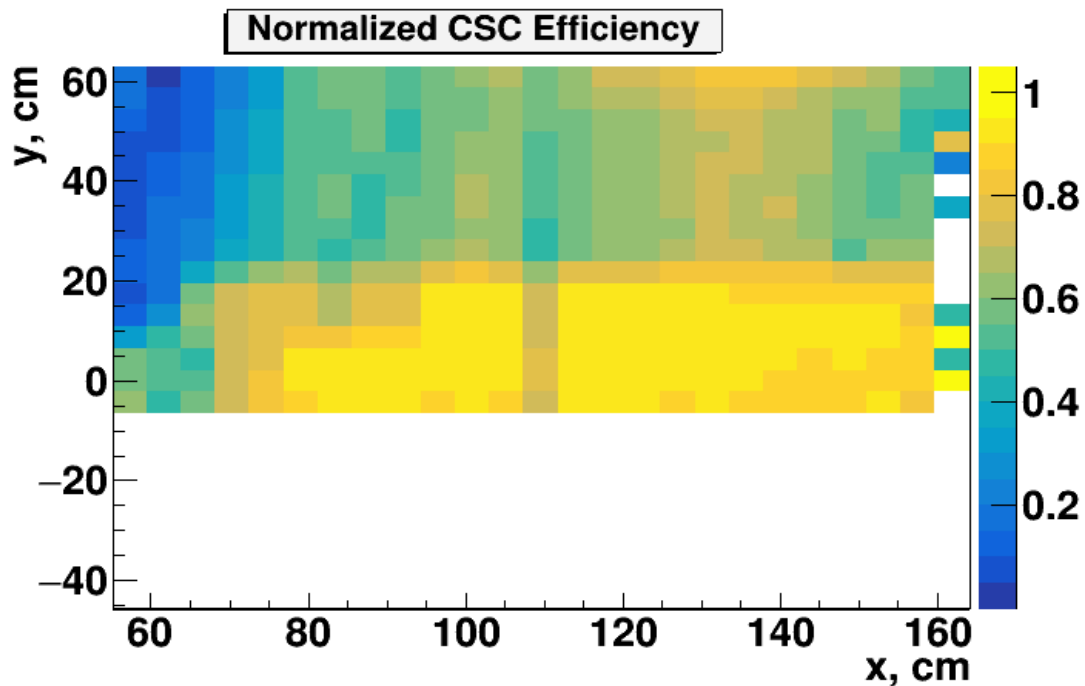

# MC CSC efficiency

- CSC efficiency calculated using MC version with Si/GEM/CSC signals normalization

- Almost entire CSC area has MC efficiency >95%

# Normalized CSC efficiency

$$\text{Eff}_{\text{CSC\_norm}} = \frac{\text{Eff}_{\text{CSC\_Data}}}{\text{Eff}_{\text{CSC\_MC}}}$$

- $\text{Eff}_{\text{CSC\_norm}} \approx \text{Eff}_{\text{CSC\_Data}}$

# The next step

- To calculate **TOF400** efficiency
