

# Tracking speedup

Mikhail Zhabitsky, JINR

09.09.2020

- GenFit2 to reconstruct track
- macro/fullchain/FitIdealTracks.C by Igor Denisenko  
 $J/\psi$  sample
- $\sim 0.3$  sec per track

- standalone executable
- google-pprof profiler
- > 80% of CPU is in Runge-Kutta algorithm within GenFit reconstruction

## Ways to speed-up:

- 1 Coarse stepping in Runge-Kutta
- 2 Specific treatment of slowly reconstructed tracks

# Time to reconstruct a track

Time to recostruct track, s

Time to recostruct track, s

# Speed-up opportunity

$$\langle t \rangle \sim \frac{300 \text{ s}}{1200 \text{ tracks}}$$

# Slow tracks = slow reconstruction

- Natural cut on  $p_{\perp} < 0.3 \text{ GeV}/c$  due to magnetic field and the steel plate in the barrel
- Early cut-off in reconstruction (stop excessive track following):

Either geometric cut on curved tracks

e.g.  $\angle(\vec{r}_{\perp}, \vec{p}_{\perp}) \geq \alpha_{\text{critical}} \quad (\alpha_{\text{critical}} \sim \pi/2)$

Or Accumulated track uncertainty greater than the expected resolution on momentum  $\sigma(p)$

but  $dE/dX$ , multiple scattering, bremsstrahlung depends on unavailable PID

- Specific treatment of slow (=curved) tracks  
In progress: implement geometric cut within GenFit to stop excessive track reconstruction  
Factor ( $3 \div 5$ ) speed-up is expected
- Coarse stepping in Runge-Kutta (gain?)
