Nucleons in Nuclear Matter and Properties of Nuclei

Ulugbek Yakhshiev

Talk@APCTP-BLTP JINR-PNPI NRC KI-SPbU
Joint Workshop “Modern Problems in Nuclear and Elementary Particle Physics"
July 24-28, 2017, Petergof, St.Petersburg

Motivation

Q. <<“Hadronic vs Nuclear” models>> vs. <<“Hadronic+Nuclear” models>>?
A. Depends on a choice which has an underlying purpose…

<u>Our (choice) aim:</u> To construct a model which describes at same footing

the single nucleon properties

- **in free space considering it as a structure-full system**
- **in nuclear medium (possible structure changes)**

as well as the properties of the whole nucleonic systems

- **infinite nuclear matter properties (EOS, volume and symmetry energy properties)**
- **matter under extreme conditions (e.g. neutron stars)**
- **few/many (ordinary/exotic) nucleon systems (symmetric nuclei, mirror nuclei, rare isotopes, halo nuclei,…)**
- **nucleon knock-out reactions (lepton-nucleus scattering experiments)**
- **possible changes in in-medium NN interactions**
- **etc**

Strategy

Q. How to construct a theoretical framework?

A. It is well known…

- **the commonly accepted and the best way is to start from QCD and try to arrive some an effective framework (unfortunately it is not completely understood yet)**
- **therefore, as much as possible main peculiarities of QCD must be taken into account in arriving an effective theory or in constructing a phenomenological approach which describe the hadrons and their interactions**
- **at low energies main peculiarities (which obvious in a single hadron sector) are**
  - **chiral symmetry and its spontaneous breakdown**
  - **quark confinement (the mechanism is not understood yet)**
- **in addition one should take into account the structure changes of in-medium nucleons in constructing the nuclear many body systems**

Content

- Topological models
- Medium modifications
- In-medium nucleons
- Nuclear matter
- Nucleon in finite nuclei
- Properties of nuclei
- Summary and Outlook

Q. What is a nucleon?
A. It seems nontrivial to answer the question…

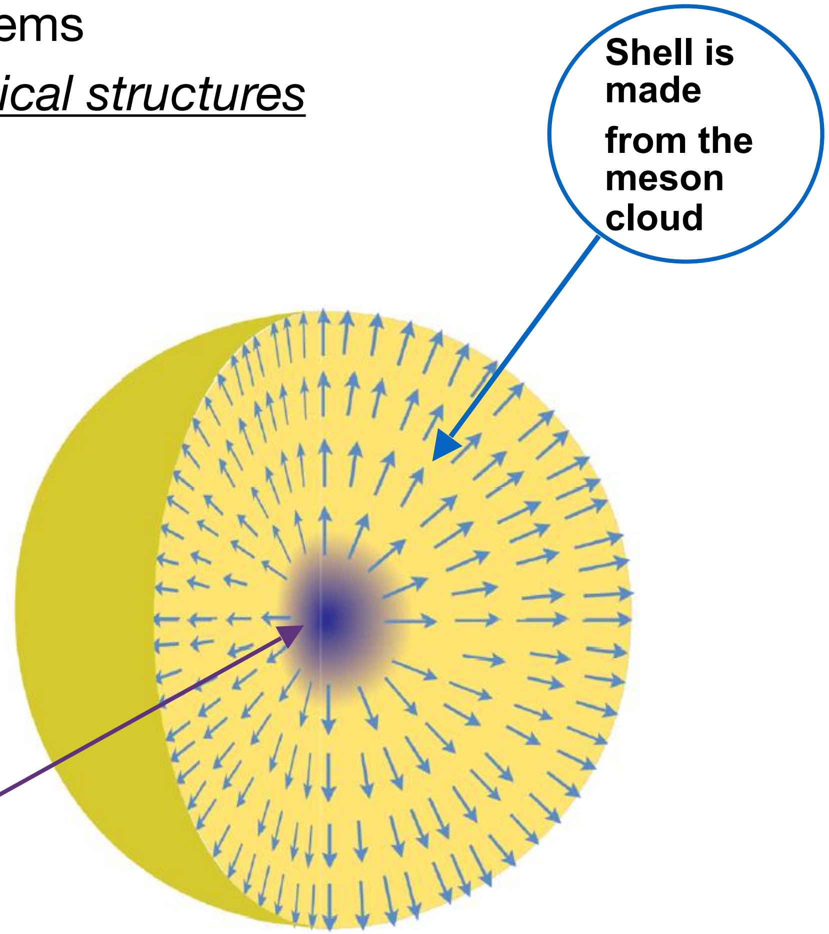
At the fundamental level we may have

- fermions -> then bosons are trivial fermion systems
- bosons -> then fermions are *nontrivial topological structures*

Structure

From what is made a nucleon and, in particular, its core in a starting boson picture approach?

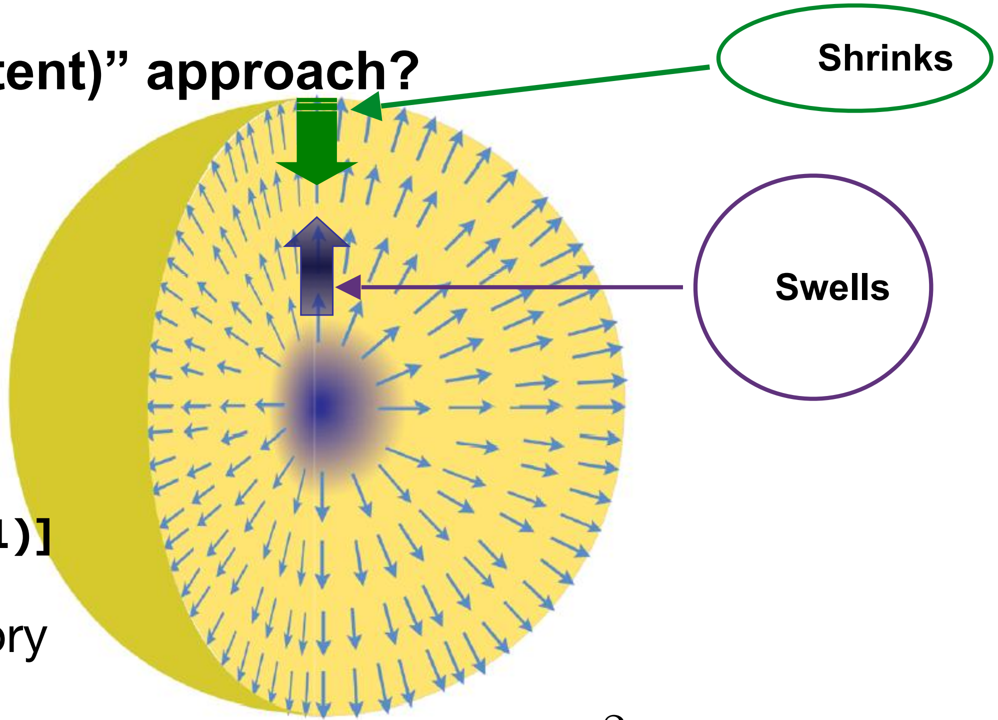
- The structure treatment depends on an energy scale
- At the limit of large number colours Nc the core still has the mesonic content



Topological models

Q. “Simple vs Complicated (more consistent)” approach?

Stabilisation mechanism



- Soliton has the finite size and the finite energy
- One needs at least two counter terms in the effective (mesonic) Lagrangian

Prototype: Skyrme model

[T.H.R. Skyrme, Pros.Roy.Soc.Lond. A260 (1961)]

- Nonlinear chiral effective meson (pionic) theory

$$\mathcal{L} = \frac{F_\pi^2}{16} \mathrm{Tr}\left(\partial_\mu U \partial^\mu U^\dagger\right) - \frac{1}{16e^2} \mathrm{Tr}\left[U^\dagger \partial_\mu U, U^\dagger \partial_\nu U\right]^2$$

Shrinking term　　　　Swelling term

- *Hedgehog* solution (nontrivial mapping)

$$U = \exp\left\{\frac{i\vec{\tau}\cdot\vec{\pi}}{2F_\pi}\right\} = \exp\{i\vec{\tau}\cdot\vec{n}F(r)\}$$

Topological models

The free space Lagrangian (which was widely in use)
[G.S.Adkins et al. Nucl.Phys. B228 (1983)]

$$\mathcal{L} = \frac{F_\pi^2}{16}\,\mathrm{Tr}\left(\partial_\mu U \partial^\mu U^\dagger\right) - \frac{1}{16e^2}\,\mathrm{Tr}\left[U^\dagger\partial_\mu U, U^\dagger\partial_\nu U\right]^2 + \frac{F_\pi^2 m_\pi^2}{16}\,\mathrm{Tr}\left(U + U^\dagger - 2\right)$$

- Nontrivial structure: topologically stable solitons with the corresponding conserved topological number (baryon number) ***A***

$$U = \exp\{i\bar{\tau}\,\bar{\pi}/2F_\pi\} = \exp\{i\bar{\tau}\,\bar{n}F(r)\}$$

$$B^\mu = \frac{1}{24\pi^2}\varepsilon^{\mu\nu\alpha\beta}Tr(L_\nu L_\alpha L_\beta) \qquad L_\alpha = U^+\partial_\alpha U$$

$$A = \int d^3 r B^0$$

- Nucleon is quantized state of the classical soliton-skyrmion which rotates in the ordinary and an internal spaces

$$H = M_{cl} + \frac{\bar{S}^2}{2I} = M_{cl} + \frac{\bar{T}^2}{2I},$$

$$|\, S = T, s, t >= (-1)^{t+T}\sqrt{2T+1}D^{S=T}_{-t,s}(A)$$

Medium modifications

Q. What happens in the nuclear medium?

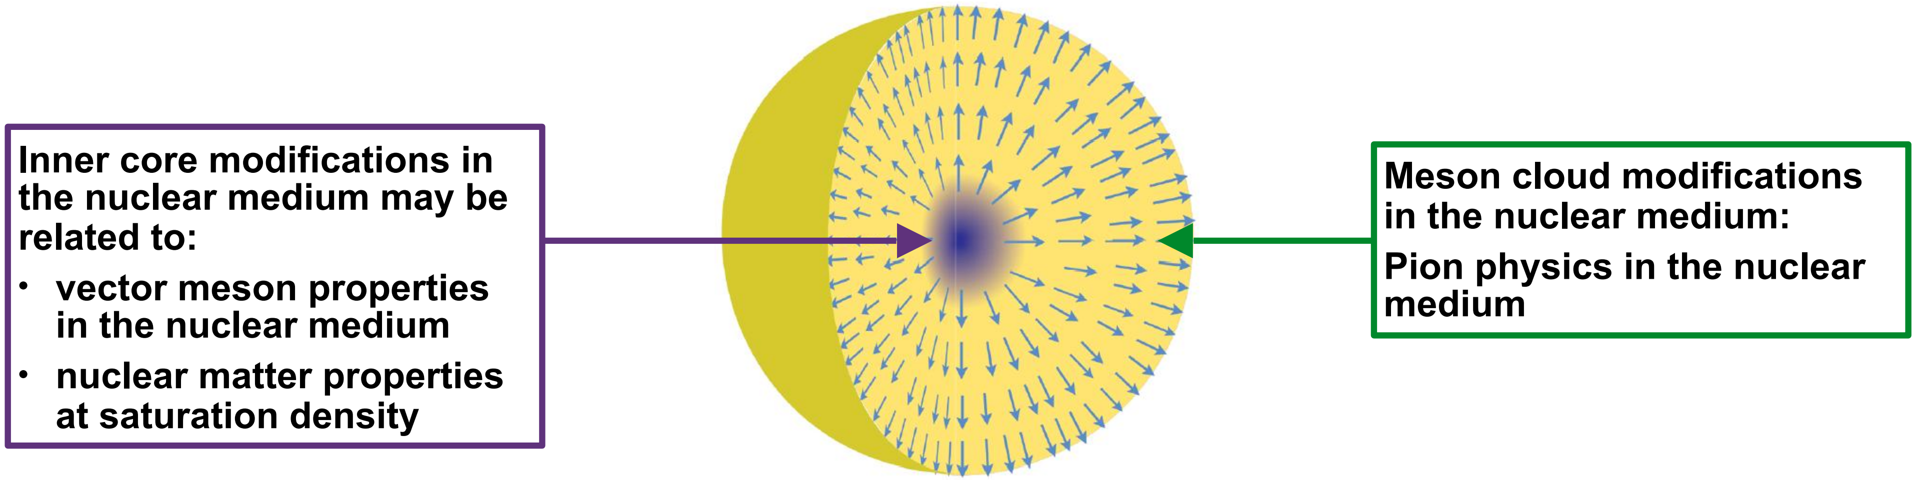
A. The possible medium effects

- Deformations (swelling or shrinking, multipole deformations) of nucleons
- Characteristic changes in: effective mass, charge distributions, all possible form factors
- NN interactions may change
- etc.

One should be able to describe all those phenomena

Soliton in the nuclear medium (phenomenological way)

- Outer shell modifications (informations from pionic atoms)
- Inner core modifications, in particular, at large densities (nuclear matter properties)



Medium modifications

“Outer shell” modifications

- In free space three types of pions can be treated separately: isospin breaking

$$(\partial^\mu \partial_\mu + m_\pi^2)\vec{\pi}^{(\pm,0)} = 0$$

- In nuclear matter: there are three types of polarization operators

$$(\partial^\mu \partial_\mu + m_\pi^2 + \hat{\Pi}^{(\pm,0)})\vec{\pi}^{(\pm,0)} = 0$$

- Optic potential approach: parameters from the pion-nucleon scattering (including the isospin dependents)

$$\hat{\Pi}^0 = 2\omega U_{\mathrm{opt}} = \chi_s(\rho, b_0, c_0) + \vec{\nabla} \cdot \chi_p(\rho, b_0, c_0)\vec{\nabla}$$

	π-atom	$T_\pi = 50$ MeV
$b_0\ [m_\pi^{-1}]$	- 0.03	- 0.04
$b_1\ [m_\pi^{-1}]$	- 0.09	- 0.09
$c_0\ [m_\pi^{-3}]$	0.23	0.25
$c_1\ [m_\pi^{-3}]$	0.15	0.16
g'	0.47	0.47

Medium modifications

"Outer shell" modifications in the Lagrangian
[U.Meissner *et al.*, EPJ A36 (2008)]

$$\mathcal{L}_2^* = \frac{F_\pi^2}{16}\alpha_\tau \mathrm{Tr}\left(\partial_0 U \partial_0 U^\dagger\right) - \frac{F_\pi^2}{16}\alpha_s \mathrm{Tr}\left(\partial_i U \partial_i U^\dagger\right)$$

$$\mathcal{L}_m^* = -\frac{F_\pi^2 m_\pi^2}{16}\alpha_m \mathrm{Tr}\left(2 - U - U^\dagger\right)$$

$$\hat{\Pi}^0 = 2\omega U_{\mathrm{opt}} = \chi_s(\rho, b_0, c_0) + \vec{\nabla}\cdot\chi_p(\rho, b_0, c_0)\vec{\nabla}$$

- Due to the non-locality of optic potential the kinetic term is also modified
- Due to energy and momentum dependence of the optic potential parameters, the following parts of the kinetic term are modified in different forms:
  - Temporal part
  - Space part

	π-atom	$T_\pi = 50$ MeV
$b_0\ [m_\pi^{-1}]$	- 0.03	- 0.04
$b_1\ [m_\pi^{-1}]$	- 0.09	- 0.09
$c_0\ [m_\pi^{-3}]$	0.23	0.25
$c_1\ [m_\pi^{-3}]$	0.15	0.16
g'	0.47	0.47

Medium modifications

“Inner core” modifications
[UY & H.Ch. Kim, PRC83 (2011); UY, JKPS62 (2013); UY, PRC88 (2013)]

$$\mathcal{L}_4^* = -\frac{1}{16e^2\zeta_\tau}\mathrm{Tr}\left[U^\dagger\partial_0 U, U^\dagger\partial_i U\right]^2 + \frac{1}{32e^2\zeta_s}\mathrm{Tr}\left[U^\dagger\partial_i U, U^\dagger\partial_j U\right]^2$$

may be related to

- Vector meson properties in nuclear matter
- Nuclear matter properties

$$\zeta_{\tau,s} = \zeta_{\tau,s}(\rho, \delta\rho, \text{parameters})$$

Medium modifications

Final Lagrangian (has proper limiting peculiarities: zero density, linear approximation)

[UY, JKPS62 (2013); UY, PRC88 (2013)]

Separated into two parts

$$\mathcal{L}^* = \mathcal{L}^*_{\rm sym} + \mathcal{L}^*_{\rm asym}$$

- Isoscalar part

$$\mathcal{L}^*_{\rm sym} = \mathcal{L}^*_2 + \mathcal{L}^*_4 + \mathcal{L}^*_m$$

- Isovector part

$$\mathcal{L}^*_{\rm asym} = \mathcal{L}^*_{\delta m} + \mathcal{L}^*_{\delta \rho}$$

- **Nuclear matter stabilization**
- **Asymmetric matter properties**

$$\mathcal{L}^*_2 = \frac{F_\pi^2}{16}\,\alpha_\tau {\rm Tr}\left(\partial_0 U \partial_0 U^\dagger\right) - \frac{F_\pi^2}{16}\,\alpha_s {\rm Tr}\left(\partial_i U \partial_i U^\dagger\right)$$

$$\mathcal{L}^*_4 = -\frac{1}{16 e^2 \zeta_\tau}\,{\rm Tr}\left[U^\dagger \partial_0 U, U^\dagger \partial_i U\right]^2 + \frac{1}{32 e^2 \zeta_s}\,{\rm Tr}\left[U^\dagger \partial_i U, U^\dagger \partial_j U\right]^2$$

$$\mathcal{L}^*_m = -\frac{F_\pi^2 m_\pi^2}{16}\,\alpha_m {\rm Tr}\left(2 - U - U^+\right)$$

$$\mathcal{L}^*_{\delta m} = -\frac{F_\pi^2}{32}\sum_{a=1}^{2}(m_{\pi^\pm}^2 - m_{\pi^0}^2){\rm Tr}\left(\tau_a U\right){\rm Tr}\left(\tau_a U^\dagger\right)$$

$$\mathcal{L}^*_{\delta\rho} = -\frac{F_\pi^2}{16}\,m_\pi \alpha_e\ \varepsilon_{ab3}{\rm Tr}\left(\tau_a U\right){\rm Tr}\left(\tau_b \partial_0 U^\dagger\right)$$

In-medium nucleons

Structure studies 1: Energy momentum tensor

- It allows to address the questions like:
  - How are the total angular momentum and angular momentum of the nucleon shared among its constituents?
  - How are the strong forces experienced by its constituents distributed inside the nucleon?
- EMT form factors in free space studied in lattice QCD, ChPT and in different models (chiral quark soliton model, Skyrme model, etc.)
- We made further step studying EMT form factors in nuclear matter

Structure studies 1: Energy momentum tensor

- Definition

$$\langle p'|\hat{T}_{\mu\nu}(0)|p\rangle = \bar{u}(p',\, s')\left[M_2(t)\,\frac{P_\mu P_\nu}{M_N} + J(t)\,\frac{i(P_\mu\sigma_{\nu\rho} + P_\nu\sigma_{\mu\rho})\Delta^\rho}{2M_N} + d_1(t)\,\frac{\Delta_\mu\Delta_\nu - g_{\mu\nu}\Delta^2}{5M_N}\right] u(p,\, s)\,,$$

- Three form factors give an information about energy distribution, angular momentum distribution and about the stabilization of strong forces inside the nucleon

$$T^*_{00}(r) \;=\; \frac{F^{*2}_{\pi,s}}{8}\left(\frac{2\sin^2 F}{r^2} + F'^2\right) + \frac{\sin^2 F}{2\,e^{*2}\,r^2}\left(\frac{\sin^2 F}{r^2} + 2F'^2\right) + \frac{m^{*2}_\pi F^{*2}_{\pi,s}}{4}\,(1-\cos F)\,,$$

$$T^*_{0k}(\boldsymbol{r},\boldsymbol{s}) \;=\; \frac{\epsilon^{klm} r^l s^m}{(\mathrm{s}\times\mathrm{r})^2}\,\rho^*_J(r)\,,$$

$$T^*_{ij}(\boldsymbol{r}) \;=\; s^*(r)\left(\frac{r_i r_j}{r^2} - \frac{1}{3}\,\delta_{ij}\right) + p^*(r)\,\delta_{ij}$$

$$M^*_2(t) - \frac{t}{5M^{*2}_N}\,d^*_1(t) \;=\; \frac{1}{M^*_N}\int \mathrm{d}^3 r\; T^*_{00}(r)\; j_0(r\sqrt{-t})\,,$$

$$d^*_1(t) \;=\; \frac{15M^*_N}{2}\int \mathrm{d}^3 r\; p^*(r)\;\frac{j_0(r\sqrt{-t})}{t}\,,$$

$$J^*(t) \;=\; 3\int \mathrm{d}^3 r\; \rho^*_J(r)\;\frac{j_1(r\sqrt{-t})}{r\sqrt{-t}}\,,$$

$$M^*_2(0) \;=\; \frac{1}{M^*_N}\int \mathrm{d}^3 r\; T^*_{00}(r) = 1\,,\qquad J^*(0) \;=\; \int \mathrm{d}^3 r\; \rho^*_J(r) = \frac{1}{2}\,.$$

In-medium nucleons

Structure studies1: Energy momentum tensor related quantities
[H.C.Kim, P. Schweitzer, UY, Phys.Lett. B718 (2012)]

Different quantities related to the nucleon EMT densities and their form factors: $T_{00}^*(0)$ denotes the energy in the center of the nucleon; $\langle r_{00}^2\rangle^*$ and $\langle r_J^2\rangle^*$ depict the mean square radii for the energy and angular momentum densities, respectively; $p^*(0)$ represents the pressure in the center of the nucleon, whereas r_0^* designates the position where the pressure changes its sign; d_1^* is the value of the $d_1^*(t)$ form factor at the zero momentum transfer.

ρ/ρ_0	$T_{00}^*(0)$ [GeV fm^{-3}]	$\langle r_{00}^2\rangle^*$ [fm^2]	$\langle r_J^2\rangle^*$ [fm^2]	$p^*(0)$ [GeV fm^{-3}]	r_0^* [fm]	d_1^*
0	1.45	0.68	1.09	0.26	0.71	−3.54
0.5	0.96	0.83	1.23	0.18	0.82	−4.30
1.0	0.71	0.95	1.35	0.13	0.90	−4.85

Structure studies 1: Pressure distribution inside the nucleon in free space and in symmetric matter [H.C.Kim, P. Schweitzer, UY, Phys.Lett. B718 (2012)]

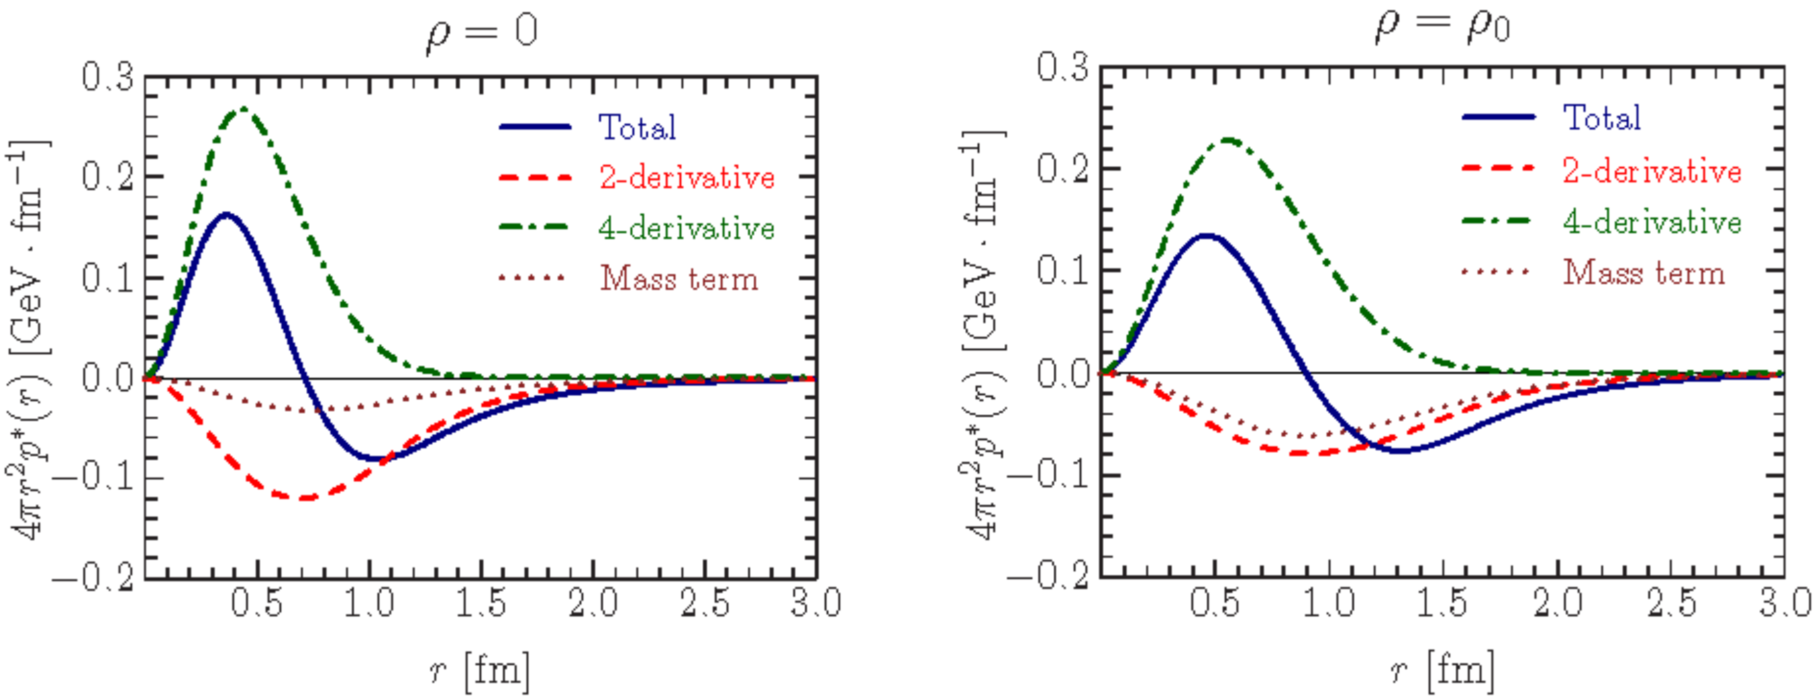


FIG. 3: (Color online) The decomposition of the pressure densities $4\pi r^2 p^*(r)$ as functions of r, in free space ($\rho = 0$) and at $\rho = \rho_0$, in the left and right panels, respectively. The solid curves denote the total pressure densities, the dashed ones represent the contributions of the 2-derivative (kinetic) term, the long-dashed ones are those of the 4-derivative (stabilizing) term, and the dotted ones stand for those of the pion mass term.

In-medium nucleons

Structure studies 2: Transverse EM charge densities

- Definition of EM ff's $\langle N(p', S') | J_\mu^{EM}(0) | N(p, S) \rangle$

$$= \bar{u}_N(p', S') \left[\gamma_\mu F_1^*(q^2) + i \frac{\sigma_{\mu\nu} q^\nu}{2m_N} F_2^*(q^2) \right] u_N(p, S)$$

- These Pauli and Dirac ff's can be expressed by Sachs ff's

$$\begin{aligned} G_E\left(Q^2\right) &= F_1\left(Q^2\right) + \frac{Q^2}{4M_N^2} F_2\left(Q^2\right) \\ G_M\left(Q^2\right) &= F_1\left(Q^2\right) + F_2\left(Q^2\right), \end{aligned}$$

- They give an information about transverse charge distributions inside the nucleon

$$\rho_0^*(b) = \int_0^\infty \frac{Q\,dQ}{2\pi} J_0(bQ) \frac{G_E^*(Q^2) + \tau G_M^*(Q^2)}{1+\tau}$$

$$\rho_T^*(\boldsymbol{b}) = \rho_0^*(b) - \sin(\phi_b - \phi_S) \times \int_0^\infty \frac{Q^2\,dQ}{4\pi m_N} J_1(bQ) \frac{-G_E^*(Q^2) + G_M^*(Q^2)}{1+\tau}$$

$$\boldsymbol{b} = b(\cos\phi_b \hat{\boldsymbol{e}}_x + \sin\phi_b \hat{\boldsymbol{e}}_y)$$

In-medium nucleons

Structure studies 2: Transverse EM charge densities inside an unpolarized nucleon [UY, H.C.Kim, Phys.Lett. B726 (2013)]

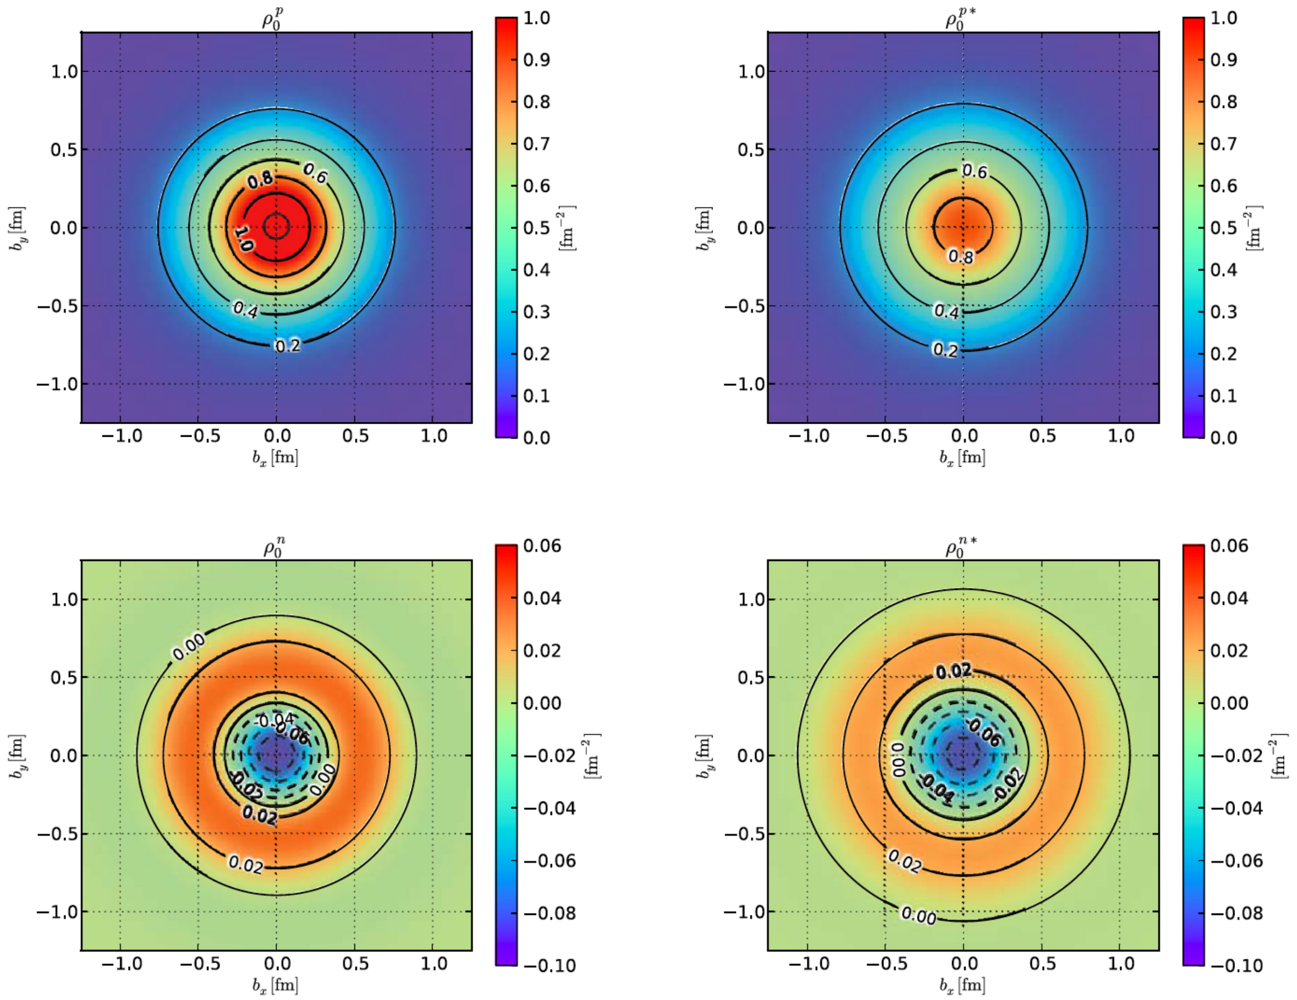

Fig. 3. Quark transverse charge densities inside an unpolarized proton (upper panels) and a neutron (lower panels) in free space (left panels) and at nuclear matter density $\rho_0 = 0.5 m_\pi^3$ (right panels).

In-medium nucleons

Structure studies 2: Transverse EM charge densities inside the polarized nucleon [UY, H.C.Kim, Phys.Lett. B726 (2013)]

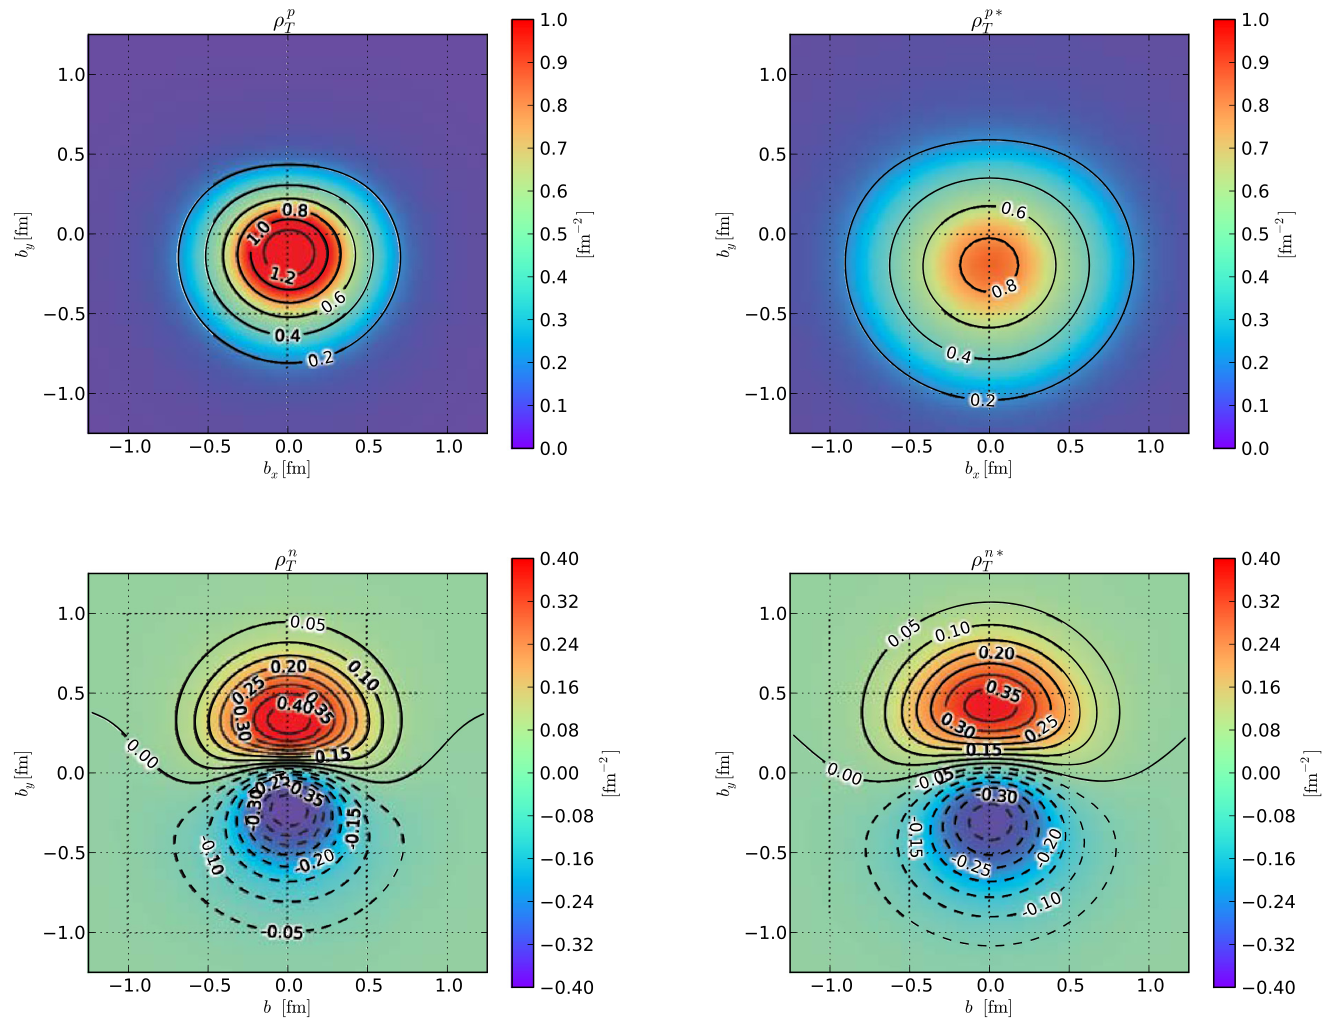

Fig. 4. Transverse charge densities of the proton (upper panels) and neutron (lower panels) in free space (left panels) and in nuclear matter with the density $\rho_0 = 0.5 m_\pi^3$ (right panels).

In-medium nucleons

Masses [UY, PRC88 (2013)]

- Isoscalar effective mass

$$m^*_{N,s} = M^*_S + \frac{3}{8\Lambda^*} + \frac{\Lambda^*}{2}\left(a^{*2} + \frac{\Lambda^{*2}_{\mathrm{env}}}{\Lambda^{*2}}\right)$$

- Isovector effective mass (relevant to: universe evolution in Early stage; stability of drip line nuclei; mirror nuclei; transport in heavy-ion collisions; asymmetric nuclear matter)

$$\Delta m^*_{np} = a^* + \frac{\Lambda^*_{\mathrm{env}}}{\Lambda^*}$$

- Effective masses of the nucleons

$$m^*_{n,p} = m^*_{N,s} - \Delta m^*_{np} T_3$$

Nuclear matter

From the Bethe-Weizsacker formula

$$\varepsilon(A,Z) = -a_V + a_S \frac{(N-Z)^2}{A^2} + $$

The binding-energy-formula terms in the framework of present model can be obtained considering

We are ready to reproduce

- Volume term
  - Symmetric infinite nuclear matter
- Asymmetry term
  - Isospin asymmetric environment
- Surface and Coulomb terms
  - Nucleons in a finite volume
- Finite nuclei properties
  - Local density approximation

Nuclear matter

The volume term and Symmetry energy

- At infinite nuclear matter approximation the binding energy per nucleon takes the form

$$\varepsilon(\lambda,\delta) = \varepsilon_V(\lambda) + \varepsilon_S \delta^2 + O(\delta^4) \equiv \varepsilon_V(\lambda) + \varepsilon_A(\lambda,\delta)$$

  - λ is normalised nuclear matter density
  - δ is asymmetry parameter
  - ε_S is symmetry energy

- In our model
  - Symmetric matter
  - Asymmetric matter

$$\varepsilon_V(\lambda) = m^*_{N,s}(\lambda,0) - m_N^{\text{free}}$$

$$\begin{aligned}\varepsilon_A(\lambda,\delta) &= \varepsilon(\lambda,\delta) - \varepsilon_V(\lambda) \\ &= m^*_{N,s}(\lambda,\delta) - m^*_{N,s}(\lambda,0) + m^*_{N,V}(\lambda,\delta)\delta\end{aligned}$$

Nuclear matter

Nuclear matter properties

- Symmetric matter properties (pressure, compressibility and third derivative)

$$p = \rho_0 \lambda^2 \left. \frac{\partial \varepsilon_V(\lambda)}{\partial \lambda} \right|_{\lambda=1}, \quad K_0 = 9\rho^2 \left. \frac{\partial^2 \varepsilon_V(\lambda)}{\partial \rho^2} \right|_{\rho=\rho_0} \quad Q = 27\lambda^3 \left. \frac{\partial^3 \varepsilon_V(\lambda)}{\partial \lambda^3} \right|_{\lambda=1}$$

- Symmetry energy properties (coefficient, slop and curvature)

$$\varepsilon_s(\lambda) = \varepsilon_s(1) + \frac{L_s}{3}(\lambda - 1) + \frac{K_S}{18}(\lambda - 1)^2 + $$

Symmetric nuclear matter

Volume energy
[UY, PRC88 (2013)]

- Set I – solid
- Set II – dashed
- Set III – dotted

For comparison: Akmal-Pandharipande-Ravenhall (APR) predictions [PRC 58, 1804 (1998)] are given by stars.

(From Arigonna 2 body interactions + 3 body interactions)

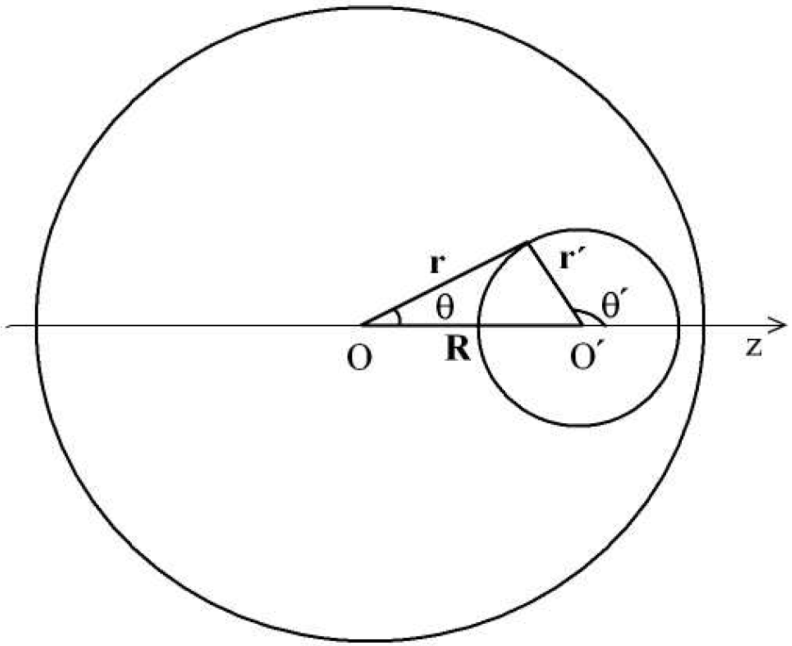
Nucleon in finite nuclei

The nucleon in a nucleus will include

- Local density approach for environment
- R dependence of a results
- Deformations
    - In particular, axially symmetric case allows the deformations in polar direction
- Polar deformations can be represented
    - in the isotopic vector and
    - in the profile function



$$\boldsymbol{N}(\boldsymbol{r}-\boldsymbol{R}) = \begin{pmatrix} \sin\Theta(\boldsymbol{r}-\boldsymbol{R})\cos\varphi \\ \sin\Theta(\boldsymbol{r}-\boldsymbol{R})\sin\varphi \\ \cos\Theta(\boldsymbol{r}-\boldsymbol{R}) \end{pmatrix}$$

$$P = P(|\boldsymbol{r}-\boldsymbol{R}|, \theta), \qquad \Theta = \Theta(|\boldsymbol{r}-\boldsymbol{R}|, \theta)$$

$$U(\boldsymbol{r}-\boldsymbol{R}) = \exp\left[i\boldsymbol{\tau}\cdot\boldsymbol{N}(\boldsymbol{r}-\boldsymbol{R})P(\boldsymbol{r}-\boldsymbol{R})\right]$$

The Equations of Motion

- The coupled partial differential equations (not an easy problem)

$$f\,(F_{\tilde{r}\tilde{r}},\,F_{\theta\theta},\,F_{\tilde{r}},\,F_{\theta},\,\Theta_{\theta},\,F,\,\Theta) = 0,$$

$$g(\Theta_{\theta\theta},\,\Theta_{\theta},\,F_{\tilde{r}},\,F_{\theta},\,\Theta,\,F) = 0,$$

- A numerical variational method can be applied

$$P(r,\theta) = 2\arctan\left\{\frac{r_0^2}{r^2}(1+m_\pi r)\big(1+u(\theta)\big)\right\} e^{-f(r)r}$$

$$\Theta(r,\theta) = \theta + \zeta(r,\theta),$$

$$F(r) = 2\arctan\left\{\frac{r_0^2}{r^2}(1+m_\pi r)\right\} e^{-f(r)r}, \qquad u(\theta) = \sum_{n=1}^{\infty}\gamma_n \cos^n\theta$$

$$f(r) = \beta_0 + \beta_1 e^{\beta_2 r^2}.$$

$$\zeta(r,\theta) = re^{-\delta_0^2 r^2}\sum_{n=1}^{\infty}\delta_n \sin 2n\theta,$$

$$\boxed{\begin{aligned}\lim_{r\to 0} F(r) &= \pi - Cr,\\ \lim_{r\to\infty} F(r) &= D\,(1+m_\pi r)\,\frac{e^{-m_\pi r}}{r^2},\end{aligned}}$$

Nucleon in finite nuclei

Accuracy of the variational method

- In spherically symmetric approximation (e.g. nucleon in the centre of the spherical nucleus) one can explicitly solve Equations of Motion and compare with results of variational method
- Skyrme term is not modified in nuclear matter (table below)

The Hamiltonian of the model

- Has the form as in the case of symmetric top

$$\hat{H} = M^*_{\rm NP} + \mathcal{M}^2_- \Lambda_{\rm mes} + \frac{\Lambda^{*2}_{\rm env}}{2\Lambda^*_{\omega\Omega,33}} + \frac{(\hat{T}_1^2 + \hat{T}_2^2)\Lambda^*_{\Omega\Omega,12} + (\hat{J}_1^2 + \hat{J}_2^2)\Lambda^*_{\omega\omega,12}}{2(\Lambda^*_{\omega\omega,12}\Lambda^*_{\Omega\Omega,12} - \Lambda^{*2}_{\omega\Omega,12})}$$

$$+ \frac{(\hat{T}_1\hat{J}_1 + \hat{T}_2\hat{J}_2)\Lambda^*_{\omega\Omega,12}}{\Lambda^*_{\omega\omega,12}\Lambda^*_{\Omega\Omega,12} - \Lambda^{*2}_{\omega\Omega,12}} + \frac{\hat{T}_3^2}{2\Lambda^*_{\omega\Omega,33}} - \boxed{\left(a^* + \frac{\Lambda^*_{\rm env}}{\Lambda^*_{\omega\Omega,33}}\right)}\hat{T}_3 \,.$$

The Nolen-Schiffer anomaly (NSA)

- The mass difference of mirror nuclei

$$\Delta M \equiv {}^{A}_{Z+1}\mathbf{M}_{N} - {}^{A}_{Z}\mathbf{M}_{N+1} = \Delta E_{\mathrm{EM}} - \Delta m^{*}_{\mathrm{np}}$$

- EM part was calculated with high accuracy (within 1% error) in very detailed form (e.g., the exchange term, the center-of-mass motion, finite-size effects of the proton and neutron charges, magnetic interactions, vacuum effects, the dynamical effect of the neutron-proton mass difference, and short-range two-body correlations, etc.)
- If neutron-proton mass difference does not change in nuclear matter then the above formula cannot be satisfied.

$$\overline{\Delta}_{\mathrm{NSA}} = \Delta m_{\mathrm{np}} - \left(\Delta\overline{m}^{*(1)}_{\mathrm{np}} + \Delta\overline{m}^{*(2)}_{\mathrm{np}} \right)$$

The Nolen-Schiffer anomaly (NSA)

- Is defined as (“bar” means averaging over the R)

$$\overline{\Delta}_{\mathrm{NSA}} = \Delta m_{\mathrm{np}} - \left(\Delta\overline{m}^{*(1)}_{\mathrm{np}} + \Delta\overline{m}^{*(2)}_{\mathrm{np}}\right)$$

- where

$$\Delta\overline{m}^{*}_{\mathrm{np}} \approx \int \left(\Delta\psi^{(2)}_{\mathrm{np}} m^{*}_{\mathrm{p}} + \left(\psi^{(p)}\right)^2 \Delta m^{*}_{\mathrm{np}}\right) \mathrm{d}^3 R$$
$$\equiv \Delta\overline{m}^{*(1)}_{\mathrm{np}} + \Delta\overline{m}^{*(2)}_{\mathrm{np}} \,,$$

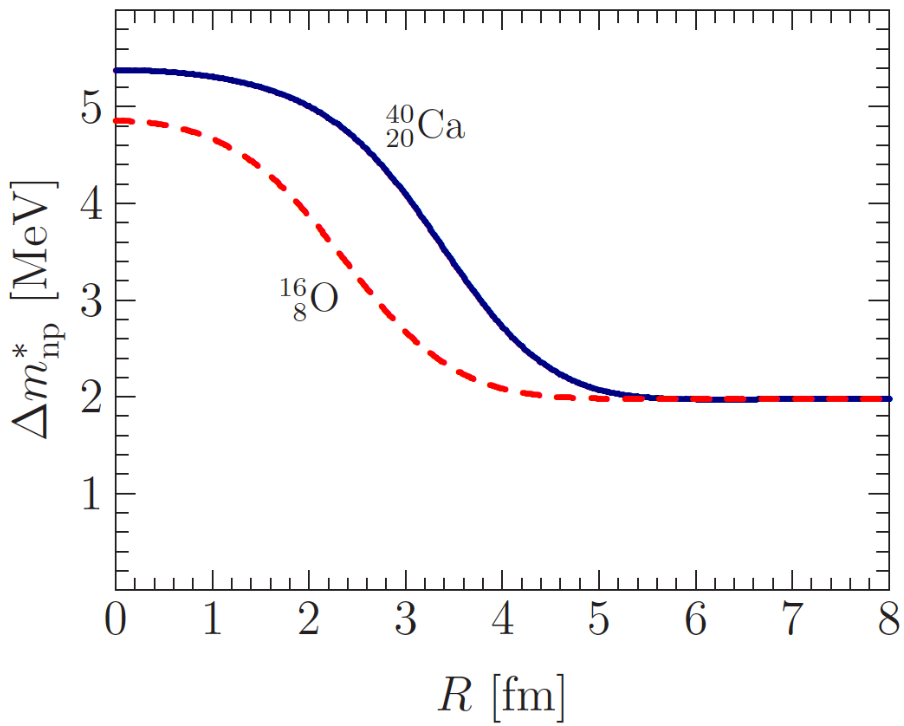
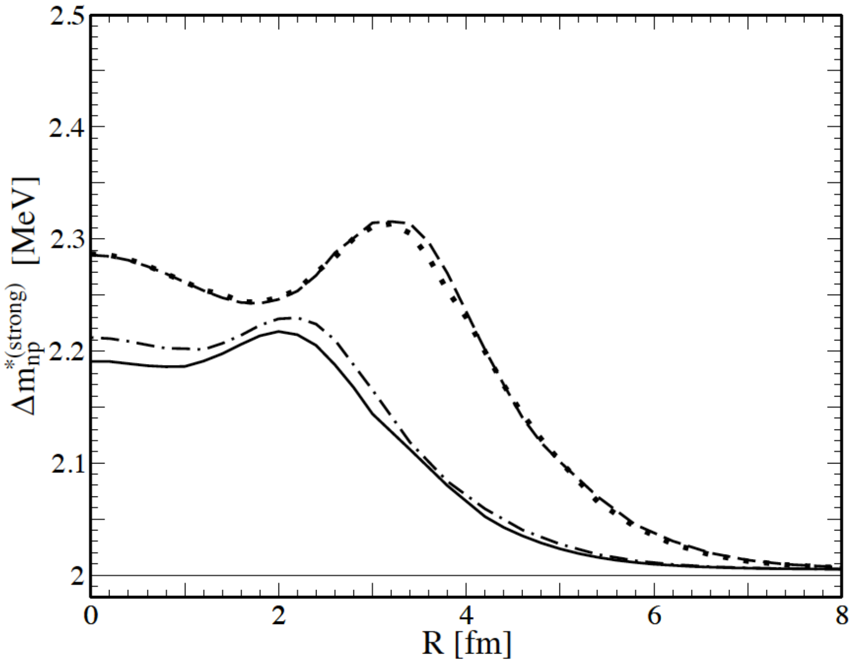
Properties of nuclei

The neutron-proton mass difference in finite nuclei





Present work (left) and U.Meissner, A.Wirzba, A.Rakhimov, UY [EPJ A36(2008)] (right)

Summary and Outlook

The present model describes at same footing

the single nucleon properties

- **in free space considering it as a structure-full system**
- **in nuclear matter (EM and EMT form factors)**

as well as the properties of the whole nucleonic systems

- **infinite nuclear matter properties (volume and symmetry energy properties)**
- **matter under extreme conditions (e.g. neutron stars)**
- **few/many nucleon systems (symmetric nuclei, mirror nuclei, rare isotopes, halo nuclei,…)**
- **nucleon knock-out reactions (lepton-nucleus scattering)**
- **possible changes in in-medium NN interactions**
- **etc**

Thank you very much for your attention!
