e-mail: Scientific_Secretary@nf.jinr.ru

Since 2012, the IBR-2 high-flux pulsed reactor (Dubna, Russia) has resumed its regular operation at nominal power for scientific research. Neutron scattering investigations at the IBR-2 reactor cover an extensive field of research in condensed matter physics, materials science, chemistry, biophysical, geophysical and engineering sciences. By the end of 2020, thirteen instruments (diffractometers, spectrometers and reflectometers) were operating under the FLNP User Program. The neutron activation analysis facility was included in the User Program starting from the last round of proposal submission (September 1 - October 15).

The current status of the User Program, statistics for 2020 and the implementation of the new web application will be presented.
