Summary

Analysis
Off-Line

- Reconstructed and corrected PHSD dataset → AuAu at $\sqrt{s_{NN}} = 7.7$ GeV by E. Nazarova
- ≈ 55000 events
- Macro for new mpdroot distribution
- Event Plane angle with ZDC, TPC and MCTracks
- Hyperons identification through its weak decay.
- Daughter tracks → ID with MC association

Summary

$\text{MC} \rightarrow \Psi_{RP}$ randomly in
 $(0^\circ, 360^\circ)$ isotropic distribution.

For reconstructed data we get the Event plane angle $\Psi_{EP}^{(n)}$:

$$\Psi_{EP}^{(n)} = \frac{1}{n} \arctan \frac{Q_y}{Q_x}$$

where:

$$Q_x = \sum_i w_i \cos(n\phi_i)$$

$$Q_y = \sum_i w_i \sin(n\phi_i)$$

Where w_i is p_T for TPC and E_{Loss} for ZDC and ϕ_i is the angle of the track or the module respectively.

Event Plane Angle - $\Psi_{EP}^{(1)}$

Analyzed data

Event Plane
Angle

Hyperon
reconstruction

Preliminary
angular
distributions

Summary

Analysis
Off-Line

The difference in angle is smaller for ZDC, and also the resolution increases for semicentral collisions.

angular
distributions

Summary

We have presented preliminary:

- Event plane angle measurement with reconstructed tracks
- Identification of hyperons
- polarization distributions

We need to increase the sample of analyzed data and compare with other samples.
