## **Gluing operation and form factors of local operators in $N=4$ SYM**

*Monday, 2 October 2017 16:30 (15 minutes)*

The gluing operation is an effective way to get form factors of both local and non-local operators starting from different representations of on-shell scattering amplitudes. In this talk we show how it works on the example of form factors of operators from stress-tensor operator supermultiplet in Grassmannian and spinor helicity representations.
