Эксперимент *LEGEND 200*:
обработка данных программой
Ругата

План доклада

- Эксперимент LEGEND -200 (кратко)
- Программа Ругама

[Home](#) [Collaboration](#) [Contact us](#)

Advantages of ^{76}Ge :

- Ge diodes are **intrinsically high purity**
- Natural abundance of 7.4%, with demonstrated ability to **enrich to $> 86\%$**
- Excellent energy resolution – **0.13% at 2039 keV**
- HPGe crystals act as both source and detector (**high detection efficiency**)
- $Q_{\beta\beta} = 2.039 \text{ MeV}$, **above most backgrounds**
- Reasonably **slow $2\nu\beta\beta$ rate ($T_{1/2} = 1.9 \times 10^{21} \text{ y}$)**
- Powerful **background rejection from pulse shape analysis**

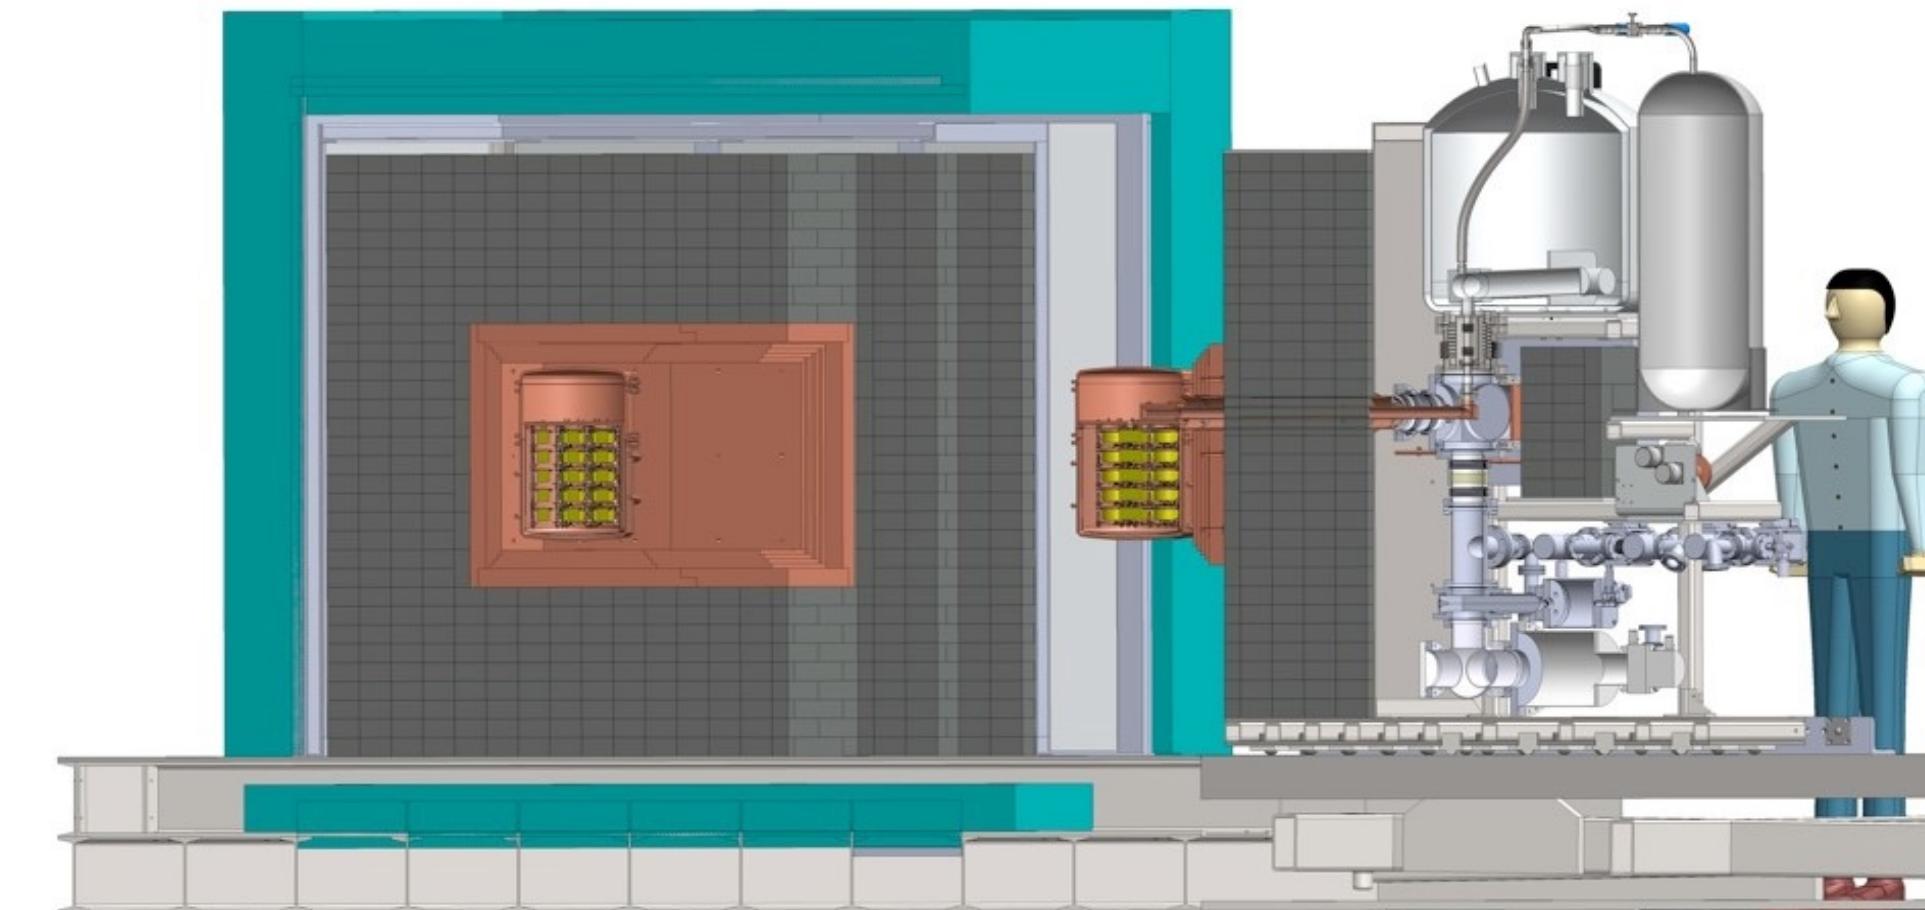

GERDA

- **Design:** Ge crystals submerged in liquid Argon at LNGS, Italy
- **Shield:** LAr, H₂O
- **Phase I:** 18 kg enr-Ge (2011)
- **Phase II:** 20 kg enr-Ge (2013)

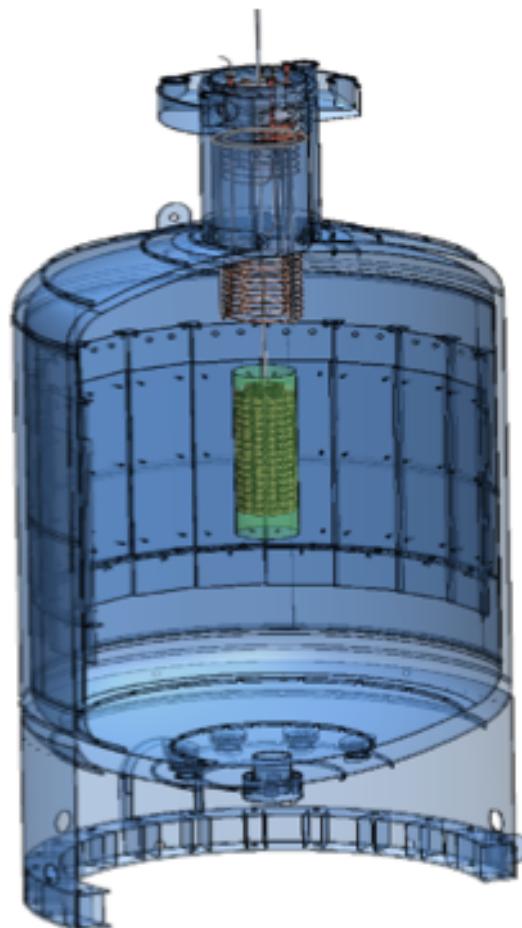

MAJORANA

- **Design:** Ge crystals in high-purity electroformed copper cryostats at Sanford Lab, US
- **Shield:** copper, lead
- **DEMONSTRATOR:** 30 kg of enr-Ge

Open exchange of knowledge and technologies
Future goal: merge for tonne-scale experiment

The Best of MAJORANA & GERDA

MAJORANA

- Radiopurity of nearby parts (FETs, cables, Cu mounts, etc.)
- Low noise electronics improves PSD
- Low energy threshold (helps reject cosmogenic background)

MAJORANA achieved best energy resolution: 2.5 keV FWHM at $Q_{\beta\beta}$

Both

- Clean fabrication techniques
- Control of surface exposure
- Development of large point-contact detectors
- Lowest background and best resolution $0\nu\beta\beta$ experiments

GERDA

- LAr veto
- Low-A shield, no Pb

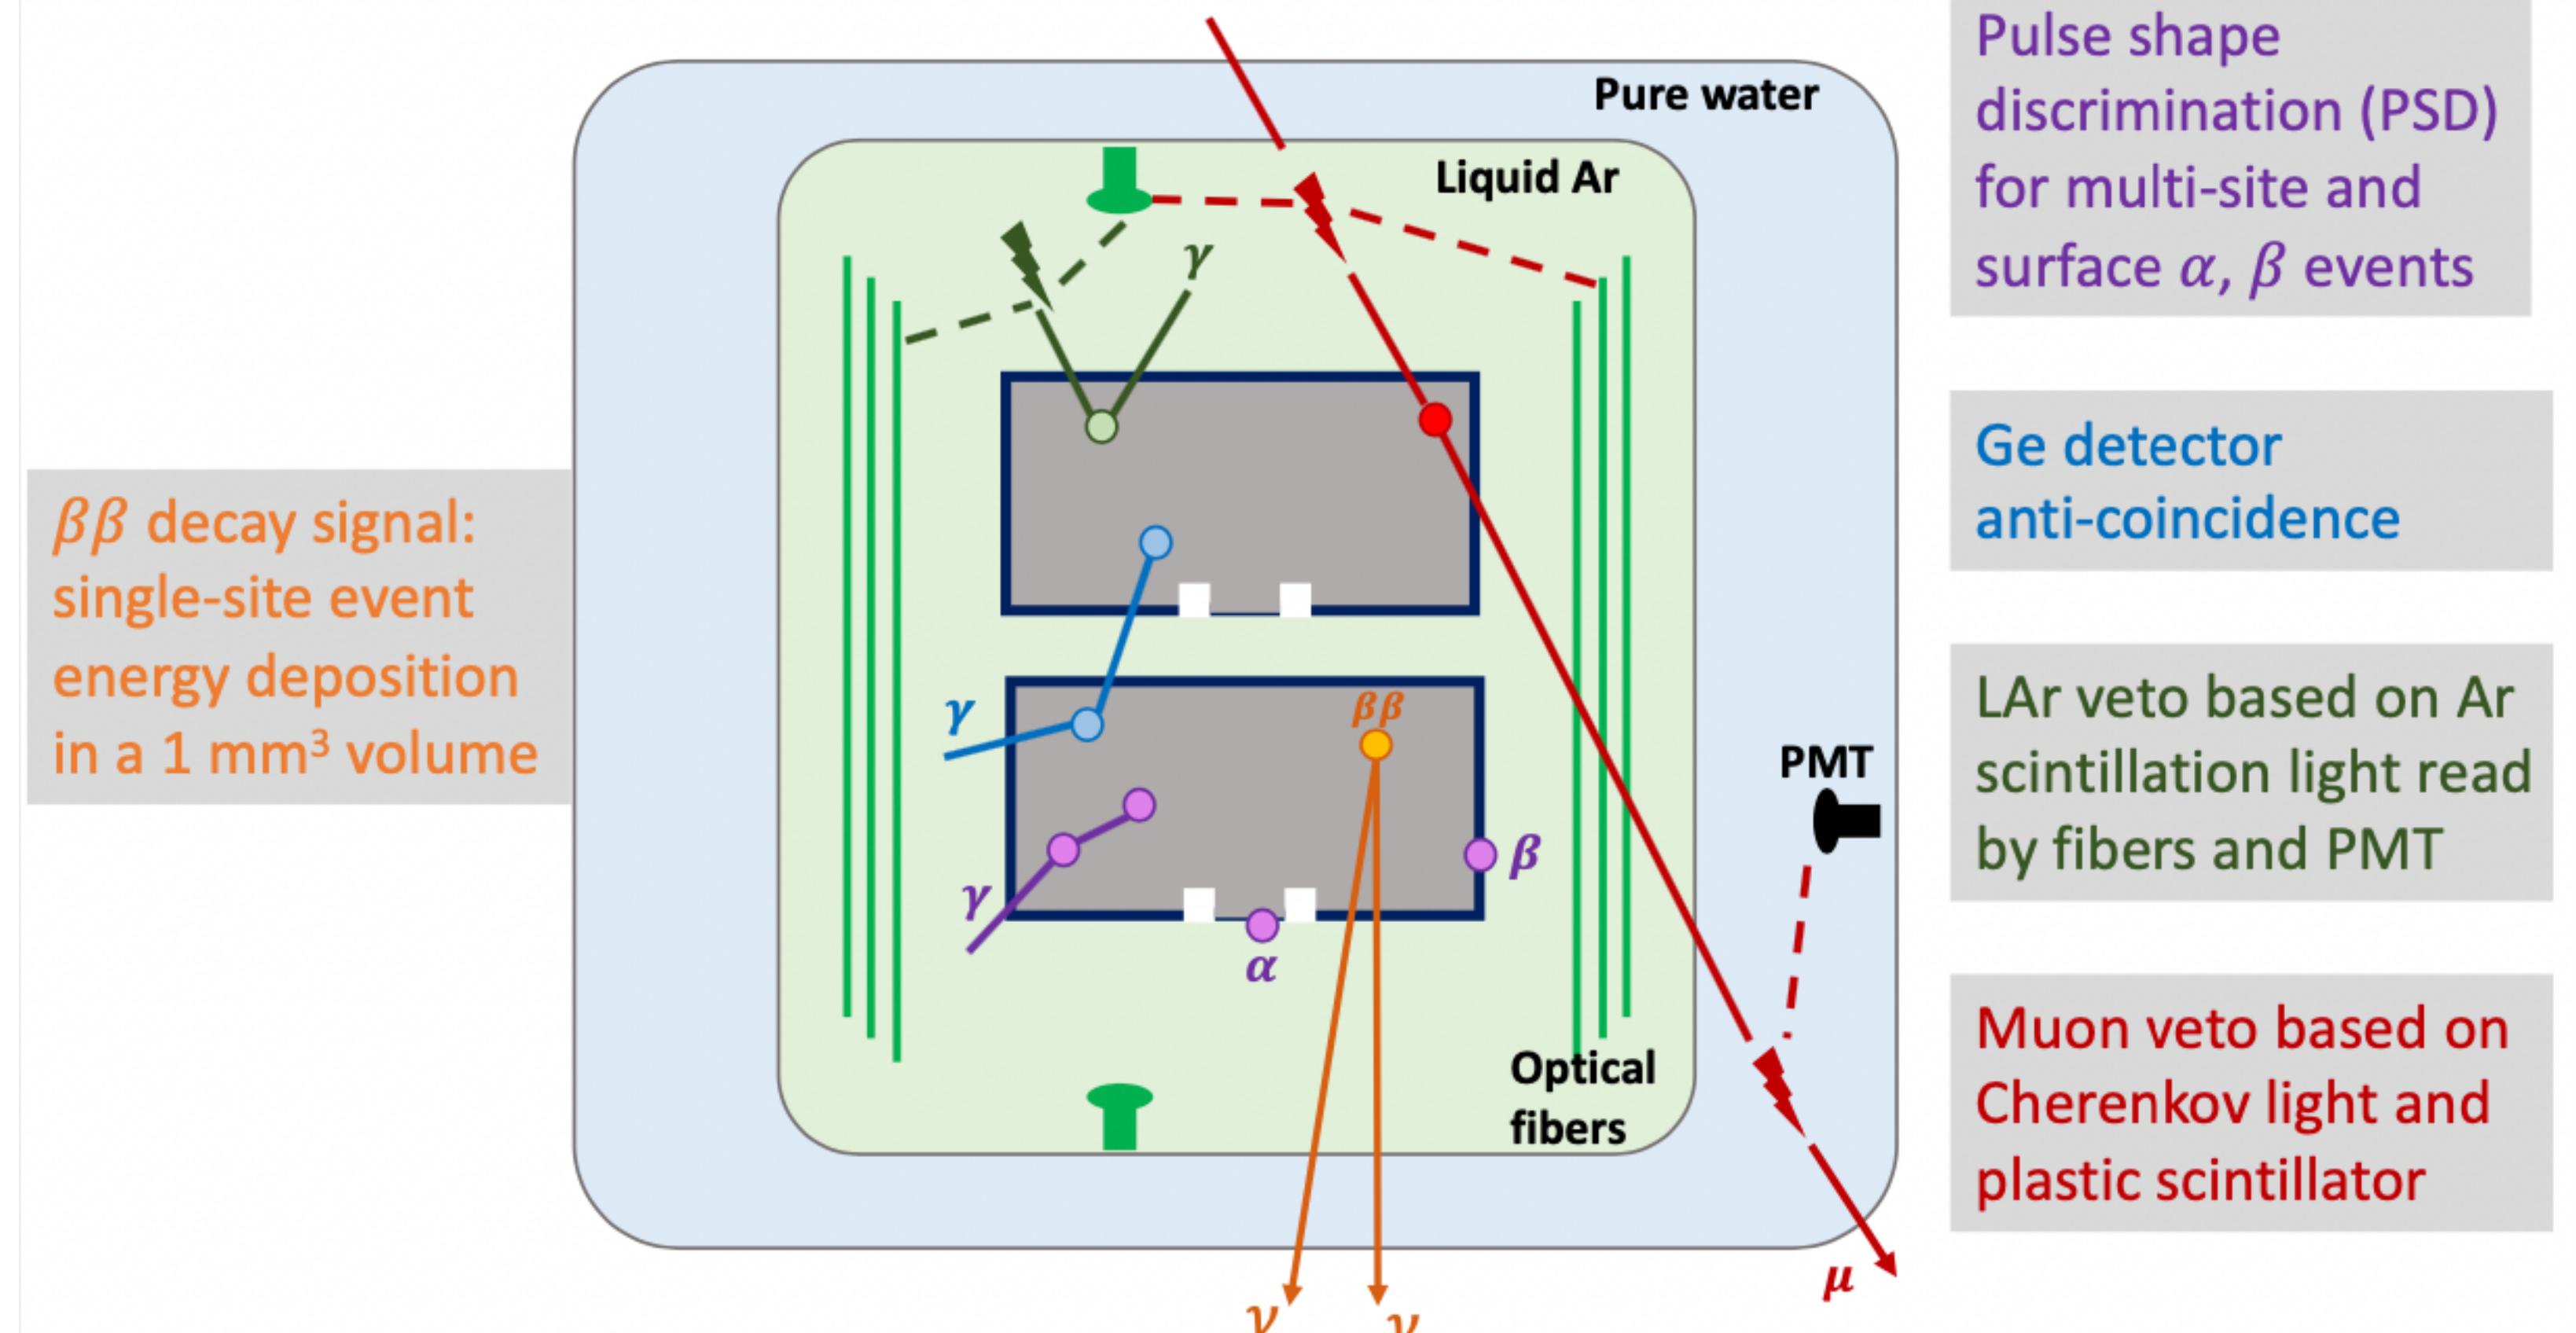

GERDA achieved the lowest background index:
 $5 \times 10^{-4} \text{ cts}/(\text{keV} \cdot \text{kg} \cdot \text{yr})$
LEGEND-200 needs only x3-5 better.

Background-free experiment design

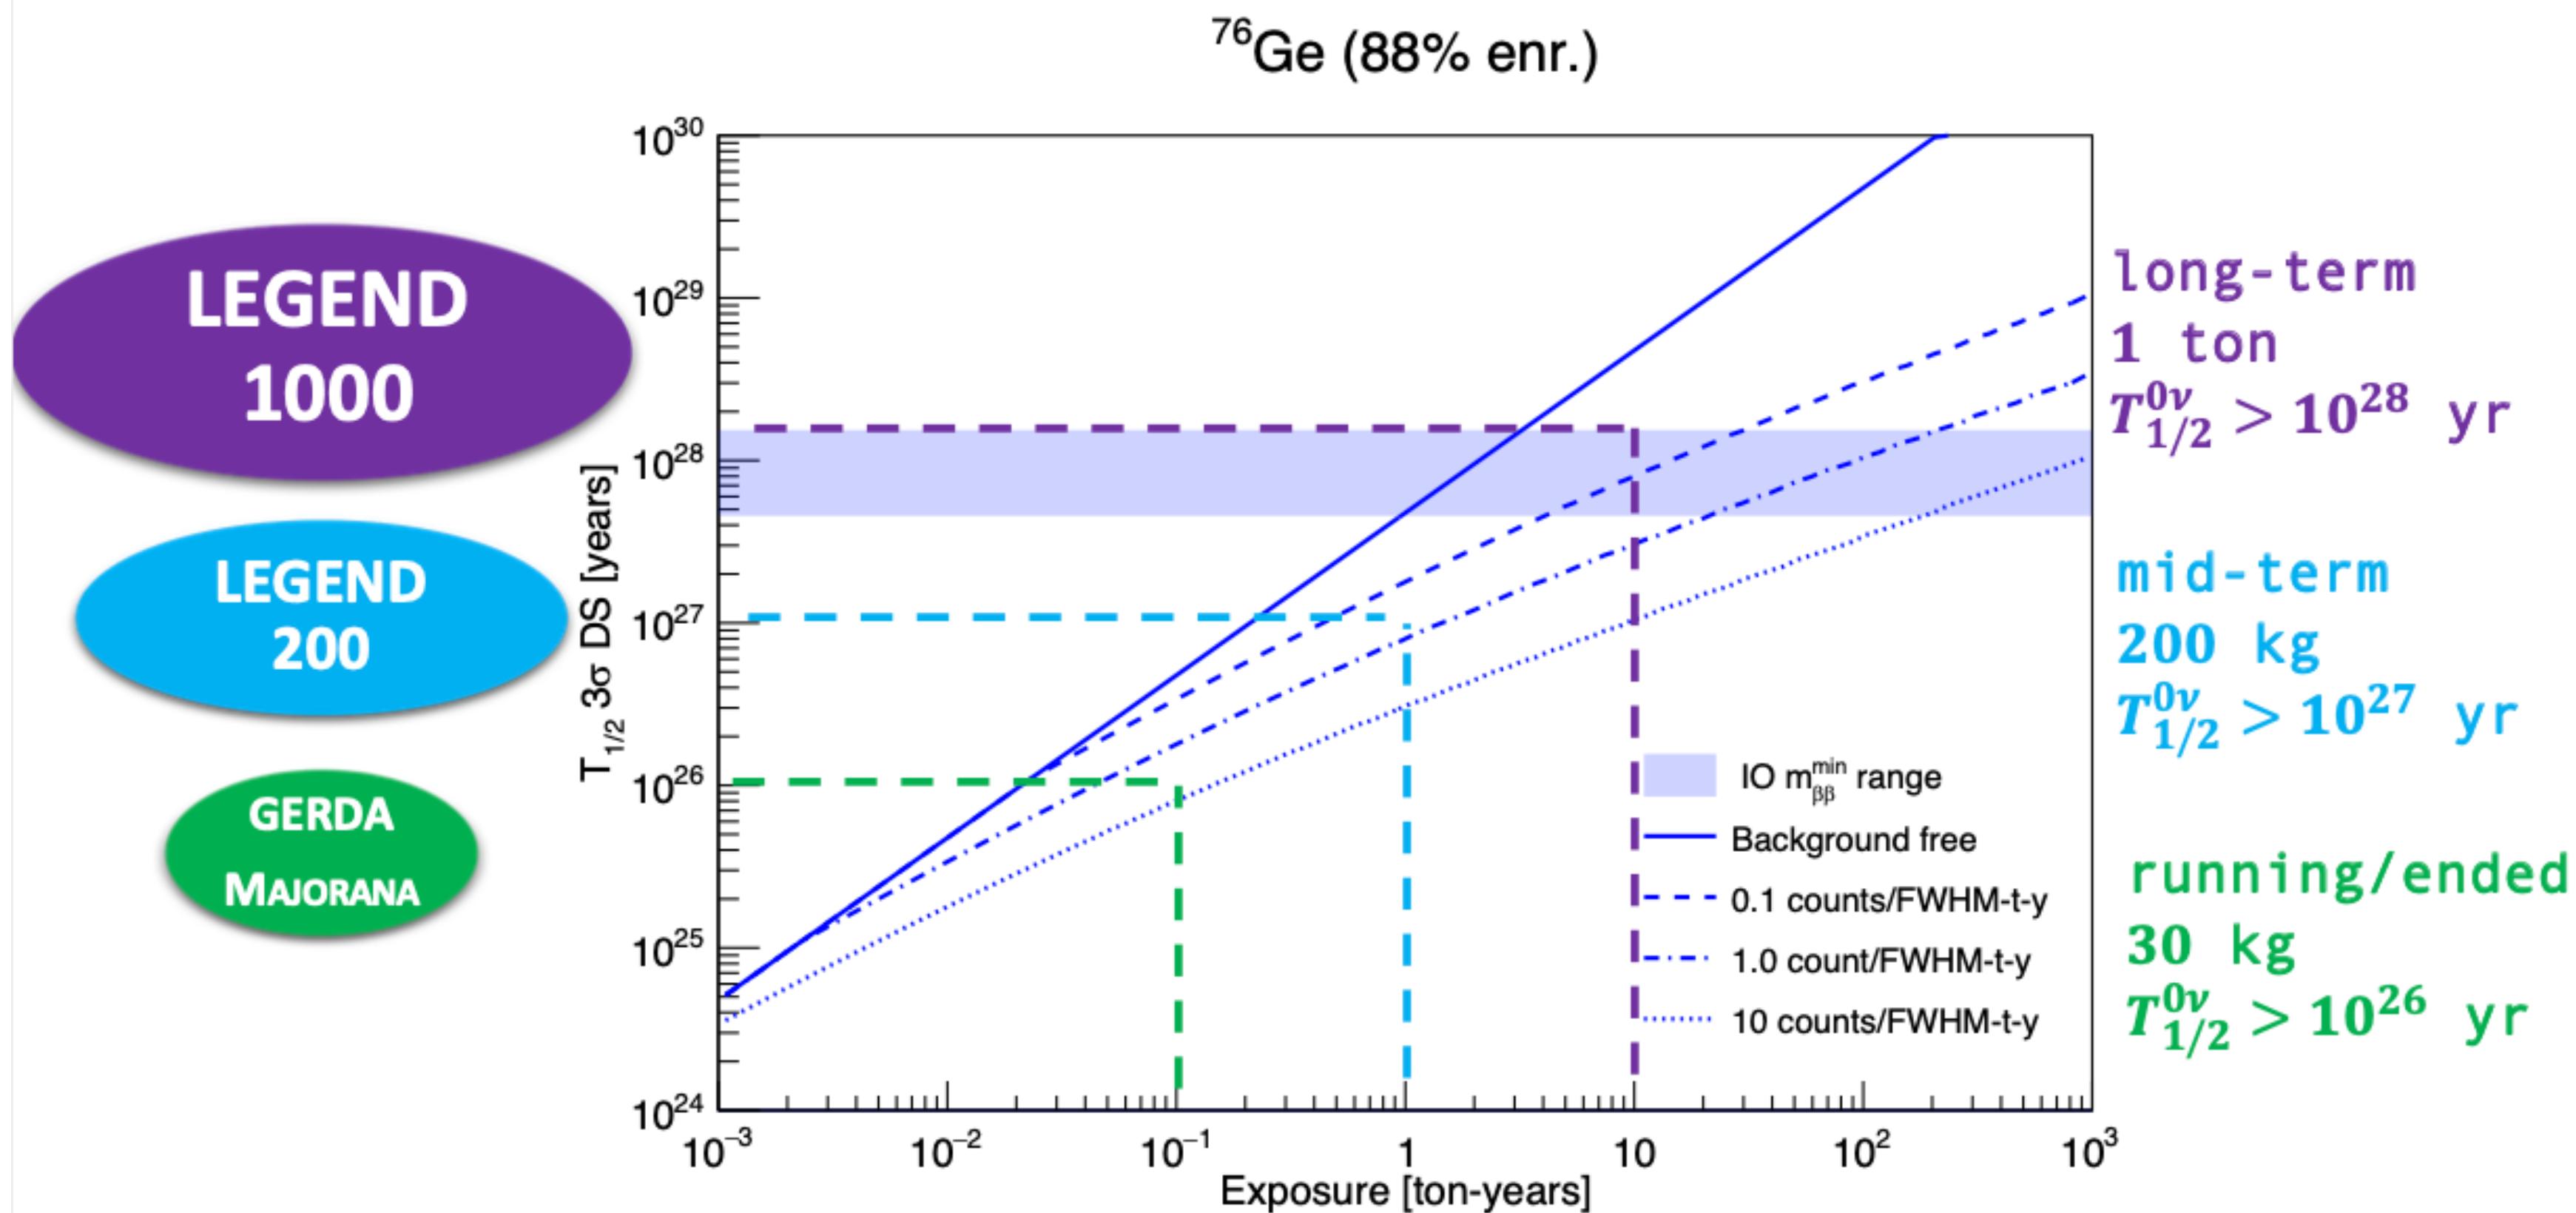

[Eur. Phys. J. C (2018) 78:388]

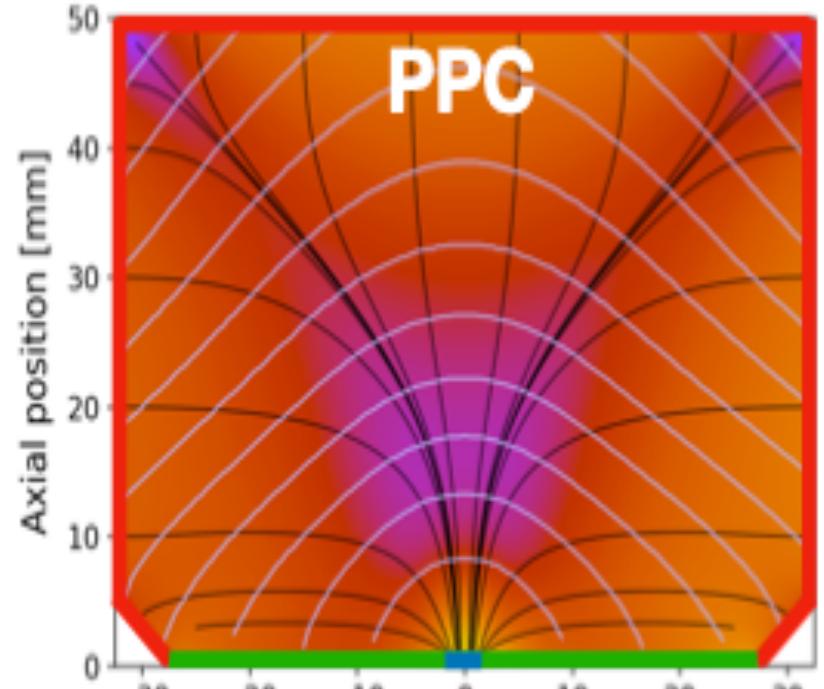

- background mitigation

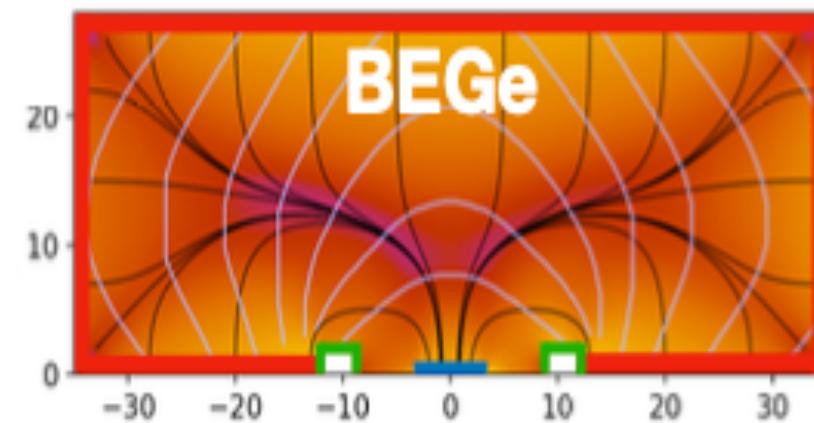

Moving forward

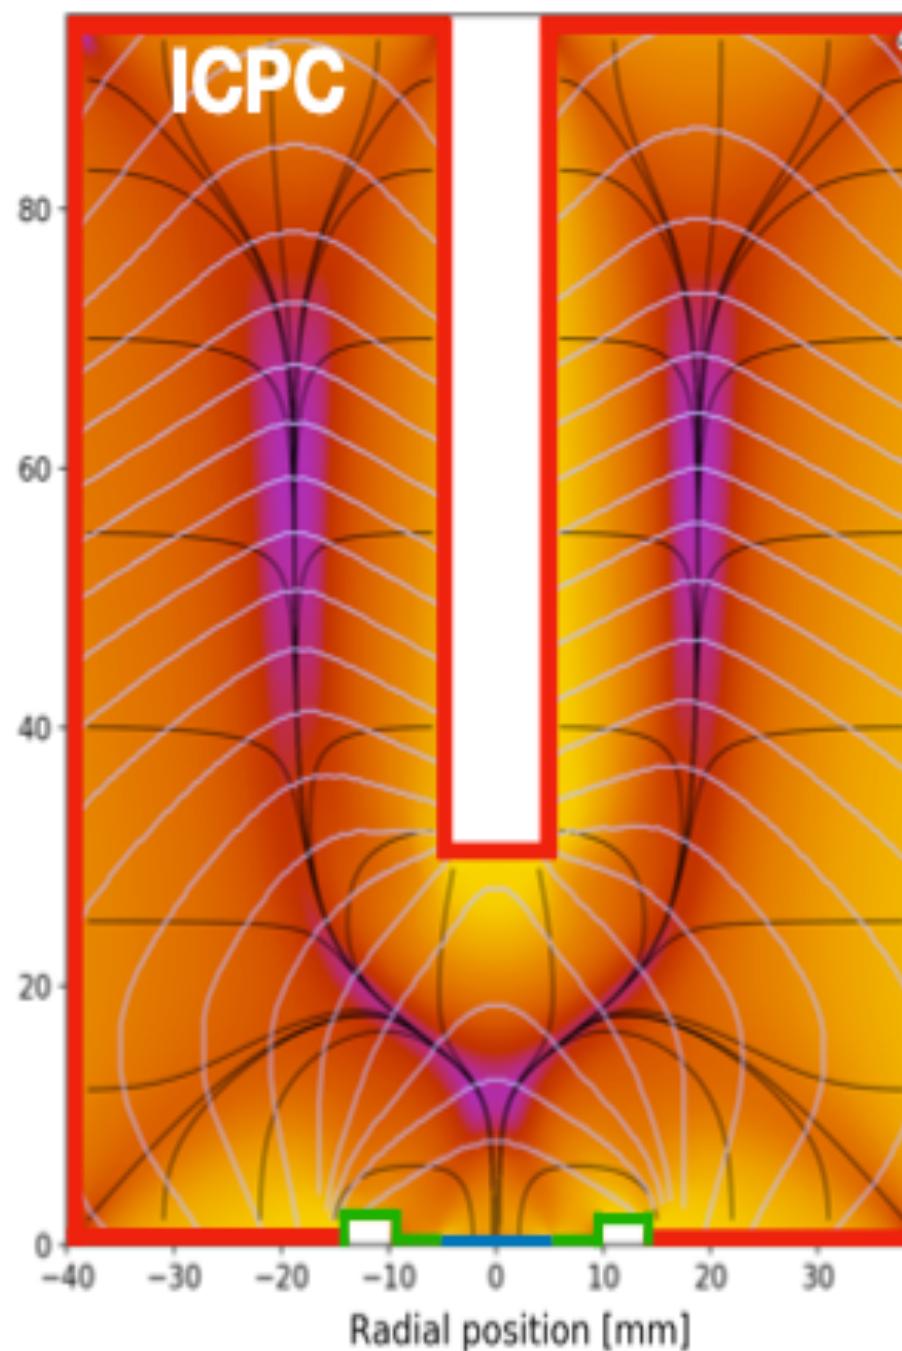

LEGEND-200 Detectors Types

p+ point contact (PPC)
35 MJD detectors (29.7 kg)

Broad Energy Germanium (BEGe)
28 GERDA detectors (19.0 kg)

Inverted coaxial point contact (ICPC)
≈80 new detectors (≈150 kg)

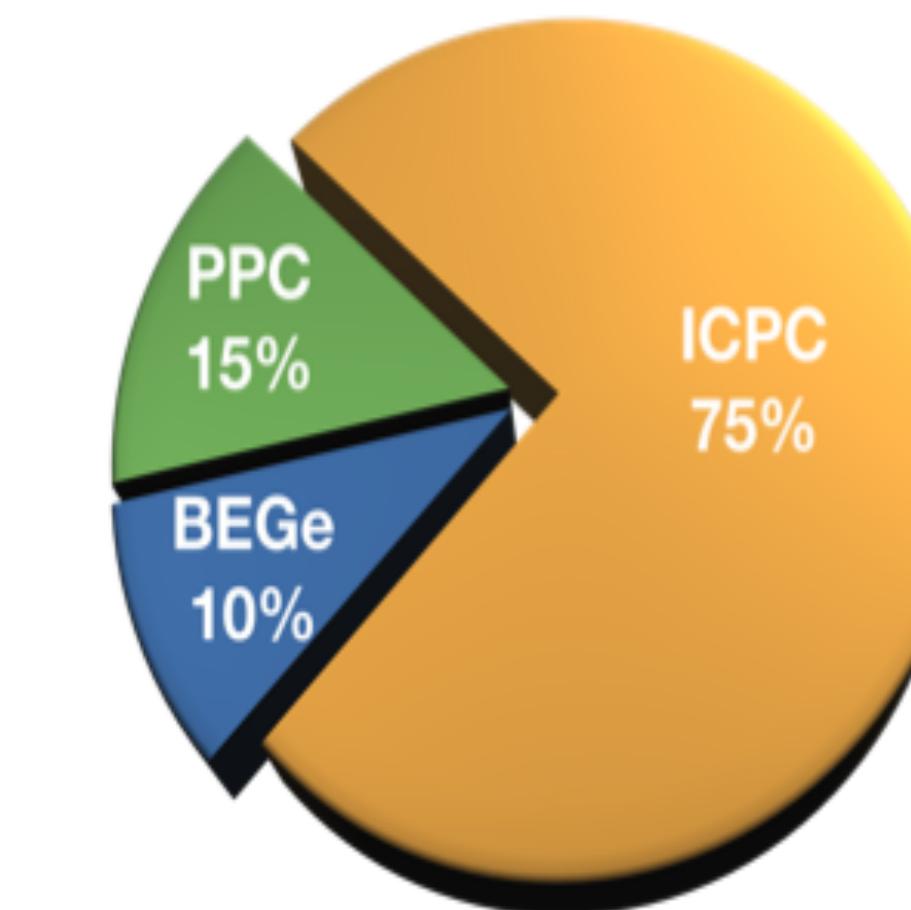

5 ICPC detectors
already deployed in
GERDA Phase II+

- Surfaces:
- n+ electrode
 - p+ electrode
 - passivation

Advantages new ICPC detectors:

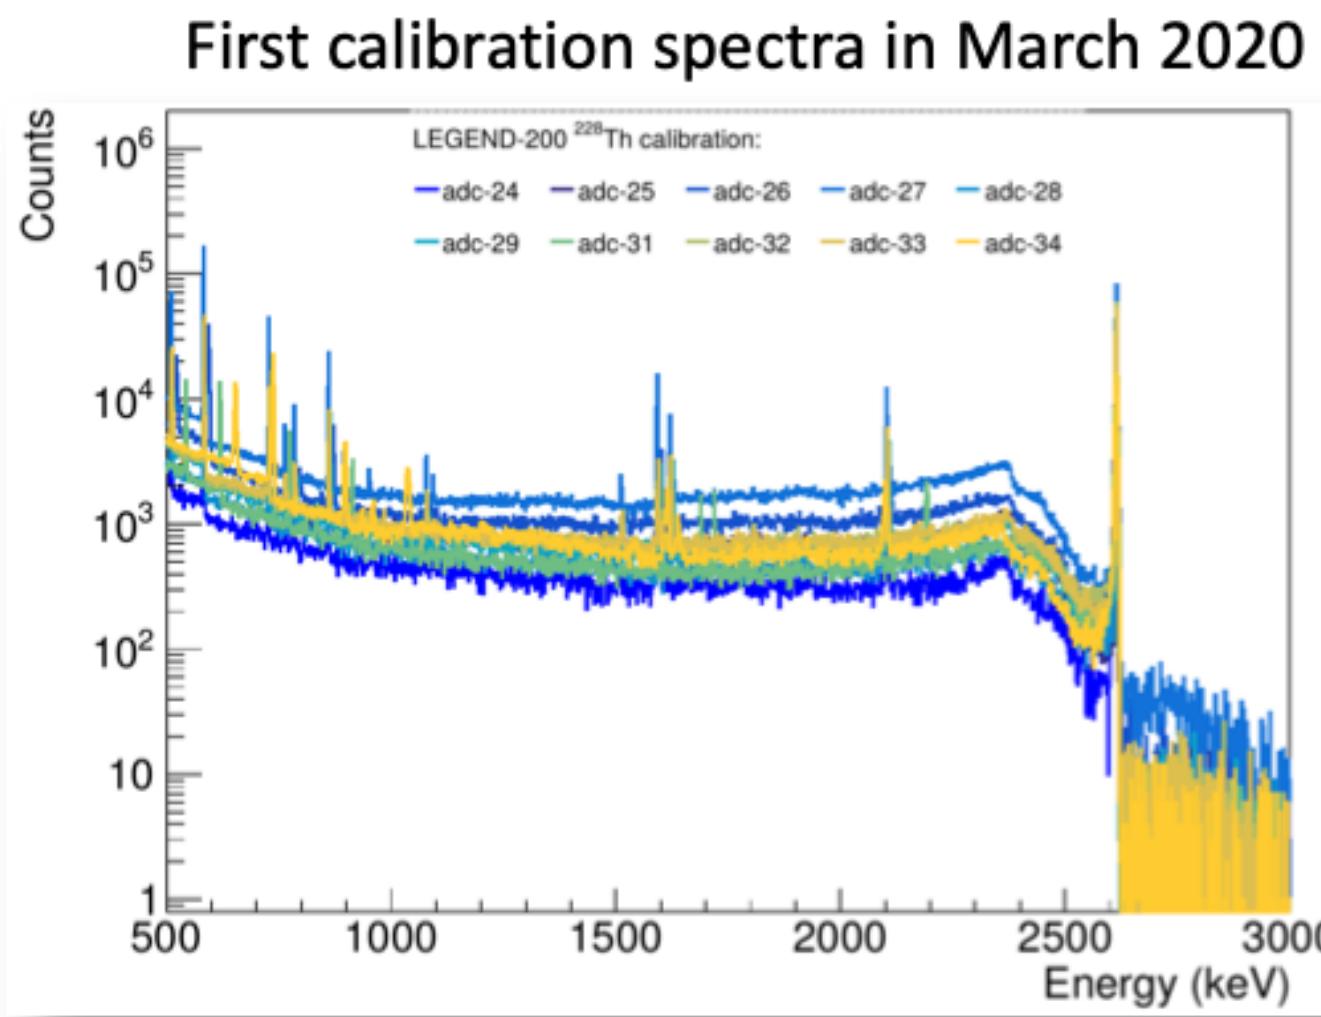

- Significantly larger (x2-4)
- Fewer channels, less background
- Better surface-volume-ratio (30-40%)
- Similar ΔE, PSD performance

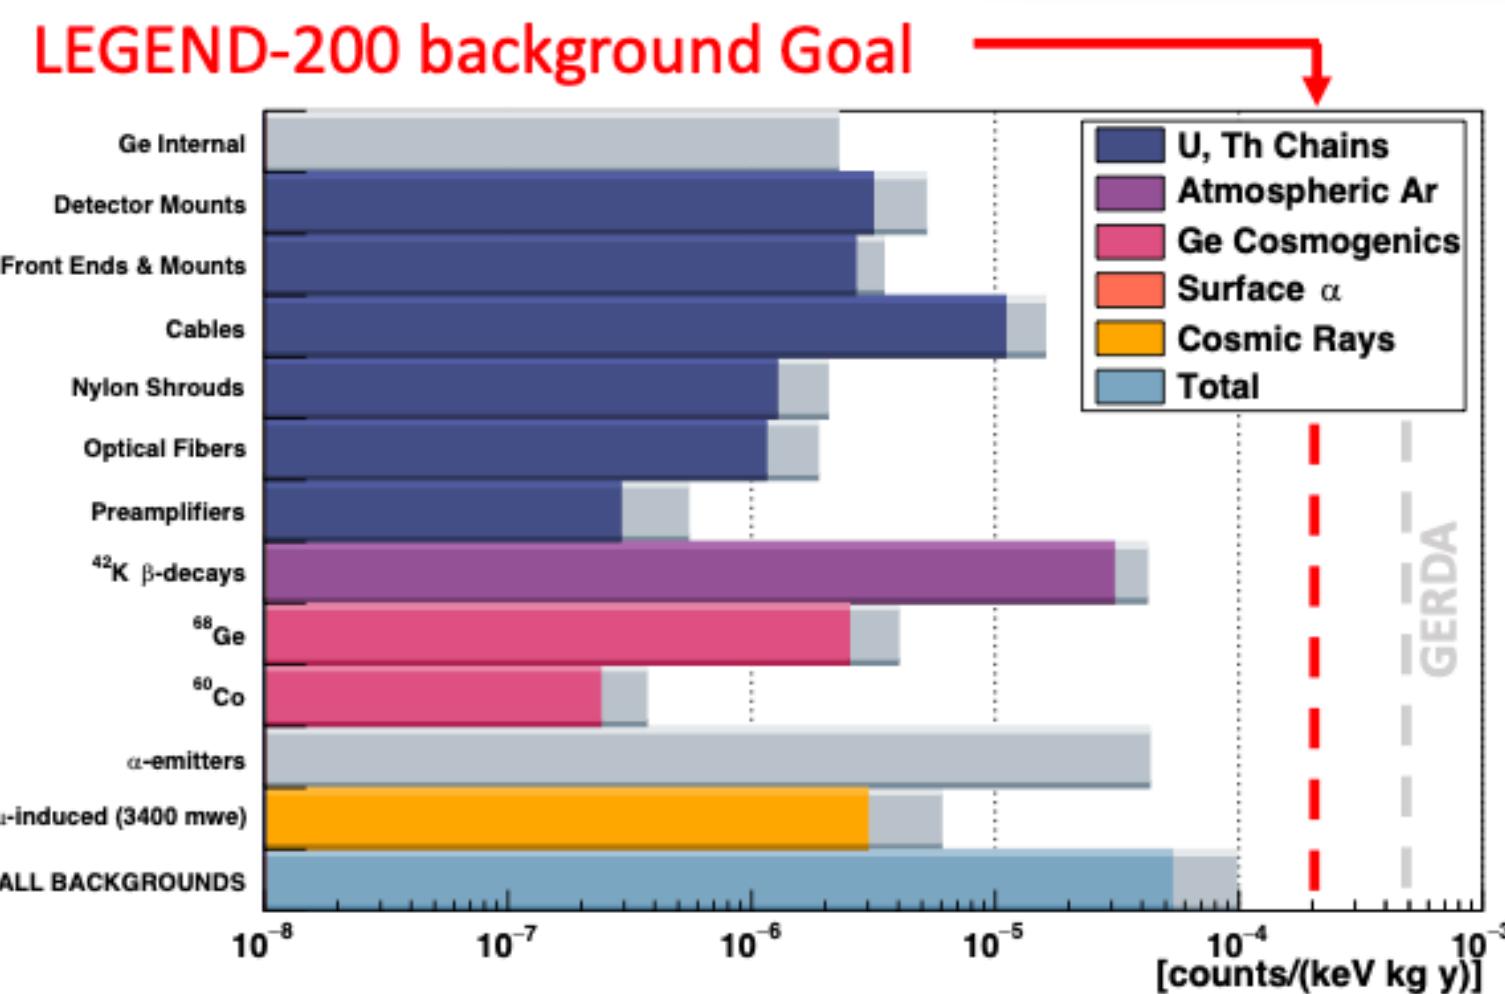

23 ICPC
detectors
already
produced

Detector composition L-200

LEGEND-200 ongoing LNGS program

- Ongoing since Feb 2020
- **GERDA detectors + 4 L200 ICPC + 5 MJD PPC detectors operating in liquid argon**
- First tests of new DAQ, calibration system under real conditions
- First spectra taken using new head electronics
- Data taking still ongoing while LNGS activities are impacted by COVID

- **Background contributions near $Q_{\beta\beta}$ after all cuts**
(NB: design exposure = 1 t · yr)
- Monte Carlo + data-driven projections of Ge U/Th, ^{42}K , α based on GERDA, MJD data
- All others: Monte Carlo + assay-based projections
- Grey bands indicate uncertainties in assays and background rejection

Computing Resources

▶ Pages 57

Collaboration-wide computing Resources for LEGEND are available at these sites:

- [Resources at NERSC](#): Simulation, data processing and storage
 - [Resources at MPIK linux cluster](#): 6000 cores (200 per user by default), few PB disk space, contact for account B.
- Schwingenheuer

- [New Members](#)
- [Code of](#)

[NERSC](#) (US National Energy Research Scientific Computing Center) has allocated storage and computing resources for LEGEND. Future allocation (to be supported by US DOE) will depend on the need of the experiment. The LEGEND contact person is Alan Poon. All LEGEND members may apply for a [user account](#) (see below).

Pygama

what is it?

A “modern” python module for reading waveform digitizer data,
and doing high-performance offline digital signal processing (DSP),
mainly using numpy, pandas, and HDF5 (h5py),
currently in working proof-of-concept stage
originally developed by Ben Shanks and Sam Meijer (UNC)

The screenshot shows the GitHub repository page for the project "legend-exp / pygama". The repository is described as a "Python package for decoding and processing digitizer data with pandas". It has 103 commits, 1 branch, 0 releases, and 3 contributors. The latest commit was made by "wiseeg" and processed successfully. There are buttons for creating new files, uploading files, and searching.

Browsing Data With h5py

- In h5py, groups are dictionaries and datasets are numpy arrays

```
bash-3.2$ python
...
>>> import h5py
>>> f = h5py.File('/global/project/projectdirs/legend/data/lngs/pgt/raw/
geds/LPGTA_r0030_20200723T141228Z_calib_geds_raw.lh5', 'r')
>>> f.keys()
<KeysViewHDF5 ['g024', 'g025', 'g026', 'g028', 'g029', 'g030', 'g031',
'g032', 'g033', 'g034', 'g035', 'g036', 'g037', 'g038', 'g039', 'g040']>
>>> f['g024'].keys()
<KeysViewHDF5 ['raw']>
>>> f['g024/raw'].keys()
<KeysViewHDF5 ['baseline', 'channel', 'energy', 'ievt', 'numtraces',
'packet_id', 'timestamp', 'tracelist', 'waveform', 'wf_max', 'wf_std']>
>>> f['g024/raw/energy'][:20]
array([ 1229,  1034,  1784,  1568, 17208,    811,   1512,   968,   574,
       846,   287,  1159,   651,   525,  3114,   753,  1368,  2428,
      246,  1566], dtype=uint16)
>>> import matplotlib.pyplot as plt
>>> plt.hist(f['g024/raw/energy'], bins=1000, histtype='step')
...
>>> plt.show()
```

Basic Histogram Fitting

- Some convenience functions in pygama

```
import matplotlib.pyplot as plt
import pygama.analysis.histograms as pgh
import pygama.analysis.peak_fitting as pga
import pygama.utils as pgu
import pygama.io.lh5 as lh5

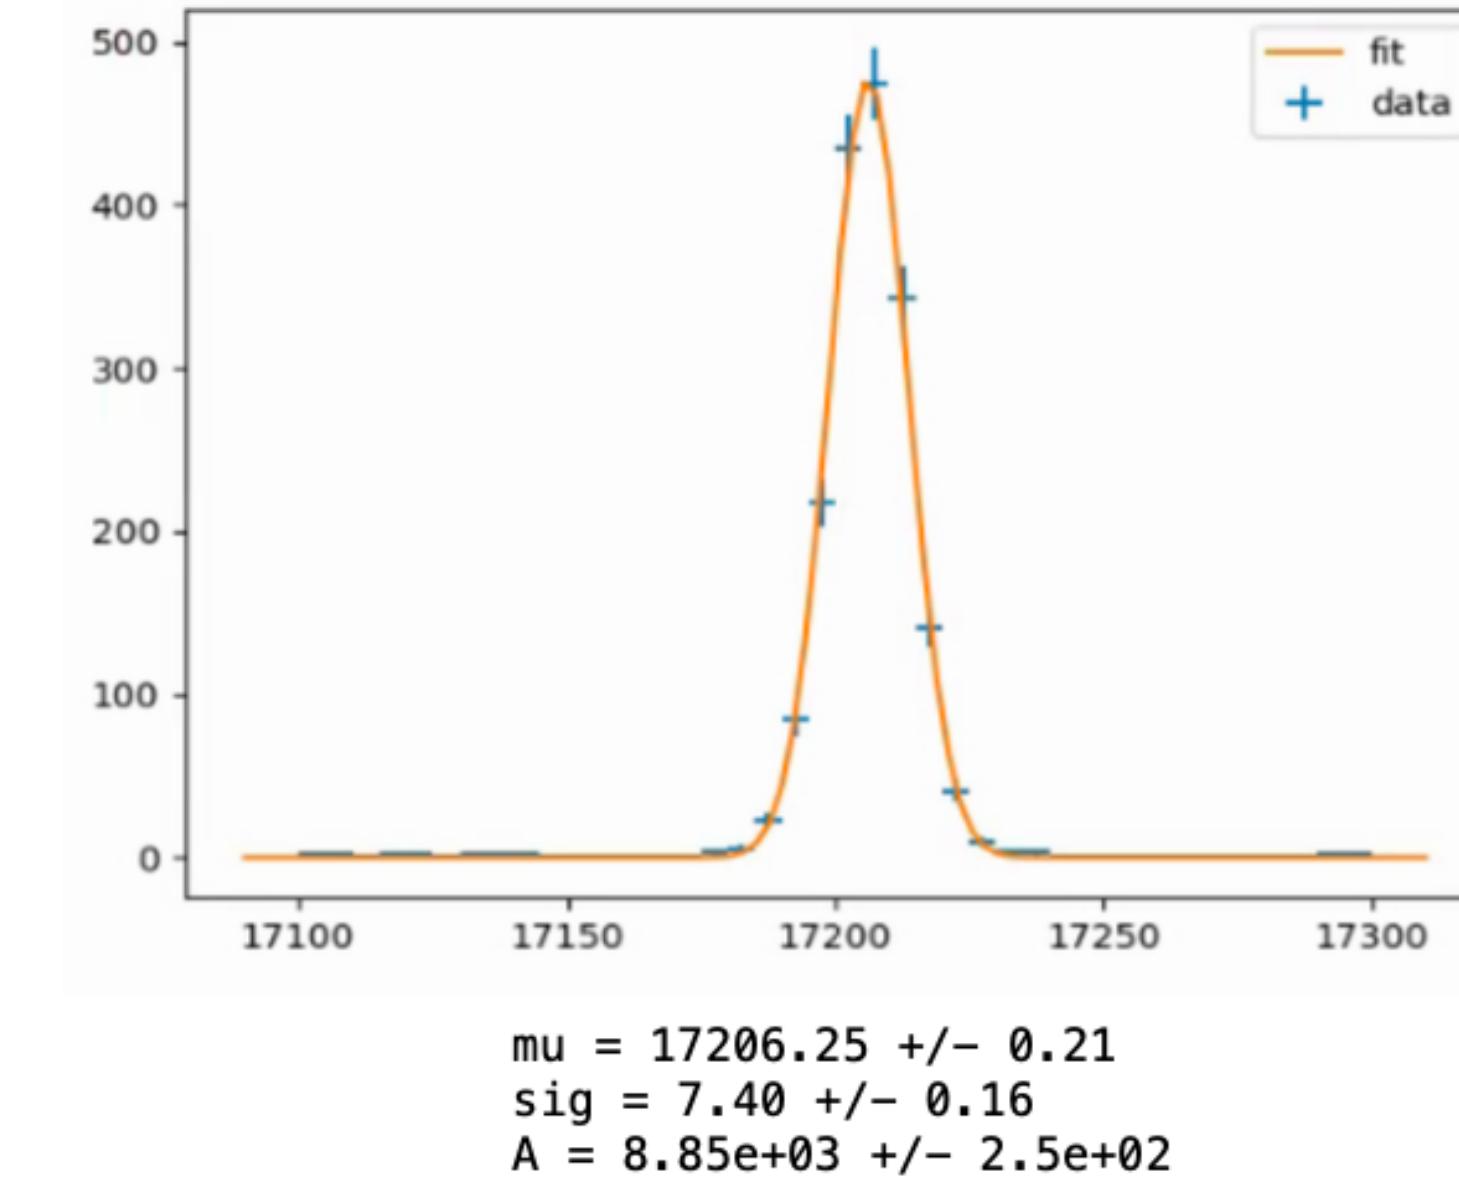

lh5_store = lh5.Store()
energies = lh5_store.read_object('g024/raw/energy', '/global/project/projectdirs/legend/data/lngs/pgt/raw/geds/LPGTA_r0030_20200723T141228Z_calib_geds_raw.lh5')

hist, bins, var = pgh.get_hist(energies.nda, range=(17100,17300), dx=5)
pgh.plot_hist(hist, bins, var, label="data")

pars, cov = pga.fit_hist(pga.gauss, hist, bins, var=var, guess=[17210,30,3000])
pgu.print_fit_results(pars, cov, ['mu', 'sig', 'A'])

Quick Plot of a Waveform

- Using h5py / numpy / matplotlib

```
bash-4.2$ pyopenh5 $LPGTA_DATA/raw/geds/  
LPGTA_r0030_20200729T185834Z_phys_geds_raw.lh5  
opening hdf5 file /global/project/projectdirs/legend/data/lngs/pgt/  
raw/geds/LPGTA_r0030_20200729T185834Z_phys_geds_raw.lh5 as f...  
>>> import numpy as np  
>>> import matplotlib.pyplot as plt  
>>> wf = f['g024/raw/waveform/values'][1,:]  
>>> plt.plot(np.arange(len(wf)), wf)  
[<matplotlib.lines.Line2D object at 0x2aaac1234460>]  
>>> plt.show()
```

- Shell function pyopenh5 in *sh:

```
pyopenh5() {  
    echo "opening hdf5 file $1 as f..."  
    python -i -c "import h5py; f = h5py.File('$1', 'r')"  
}
```

energy w/ fixed-time-pickoff

using asymmetric trapezoid (no extra code, just another instance of the trap processor)

find the t_0 of the waveform. This corrects for charge trapping

take the max of a pole-zero corrected energy trapezoid.

This is a **really good energy estimator**
