Association Workshop “Alushta - 2021”  
08.06.2021 - 15.06.2021

# Motivation of the BM@N experiment

- At  $\sqrt{s}$  energies of **2 - 4.5 GeV**, nucleon densities in a collision zone exceed the saturation density by the factor of **3-4**.
- At these densities, nucleons start to overlap and form a fireball.
- Hadrons with strangeness are early produced in the collision and not present in the initial state of two colliding nuclei.
- Heavy-ion collisions are a rich source of **strangeness**, and the coalescence of kaons with lambdas or of lambdas with nucleons will produce a vast variety of **multi-strange hyperons** or of light hypernuclei.
- Even the production of light double-hypernuclei or of double-strange dibaryons is expected to be measurable in heavy-ion collisions at Nuclotron energies.

# Run 6 BM@N configuration

$\sqrt{s_{NN}} = 2.3 - 3.5$  GeV

RUN-6 was held in spring 2017

# Analysis scheme

## $\Lambda^0$ decay reconstruction in Central tracker in C+A interaction

C + target  $\rightarrow$  X, targets: C, Al, Cu, Sn, Pb

## Selection of events with $\Lambda^0$ hyperon

## Gas Electron Multiplier (GEM) system:

To measure momenta of a charged particle and reconstruct the interaction point.

## Event topology:

PV – primary vertex

$V_0$  – vertex of hyperon decay

dca – distance of the closest approach

path – decay length

## Current task: Check residuals for MC & Data

- Residuals in MC  $\rightarrow$  **was done**
- Residuals in DATA. (See presentation Khukhaeva Anastasia)

# MC residuals vs. x per station

## Before correction

Residual is the distance  
between the extrapolated  
track and the hit

Hit is the reconstructed  
point of the detector

## Correction procedure:

- 1) Get slices along x GEM coordinate:  $dx(x)$
- 2) Fit each slice using Gaus+ pol2 function
- 3) Get Mean & Sigma from the fit
- 4) Make plots: dependencies Mean  $dx(x)$ , Sigma  $dx(x)$  for each GEM station
- 5) **Fit Mean  $DX(x)$  distributions using pol5 functions for negative & positive x**
- 6) **Apply corrections using pol5 fit functions**
- 7) Check results after first correction
- 8) Make refit procedure (points 1-7)
- 9) Check and compare distributions for MC: Mean  $dx(x)$ , Sigma  $dx(x)$ , Mean  $dx(Mom)$ , Sigma  $dx(Mom)$

# MC mean vs. x per station before correction

Mean of dXsmo versus xsmo (all tracks)

Mean of dXsmo versus xsmo (all tracks)

Mean of dXsmo versus xsmo (all tracks)

- Red line - Fit pol5(neg area)
- Blue line - Fit pol5(pos area)

**C+Cu, 4.0 GeV**

Mean of dXsmo versus xsmo (all tracks)

Mean of dXsmo versus xsmo (all tracks)

Mean of dXsmo versus xsmo (all tracks)

# MC mean vs. x per station for all iterations

Mean dX vs. x ista==1 (MC 4.0GeV C+Cu)

Mean dX vs. x ista==2 (MC 4.0GeV C+Cu)

Mean dX vs. x ista==3 (MC 4.0GeV C+Cu)

- - Mean refit pol5+Gaus
- - Mean before correction

C+Cu, 4.0 GeV

Mean dX vs. x ista==4 (MC 4.0GeV C+Cu)

Mean dX vs. x ista==5 (MC 4.0GeV C+Cu)

Mean dX vs. x ista==6 (MC 4.0GeV C+Cu)

Sigma dX vs. x ista==3

- - sigma Al target
- - sigma Pb target
- - sigma Cu target
- - sigma C target

C + target, 4.5 GeV

Sigma dX vs. x ista==4

Sigma dX vs. x ista==5

Sigma dX vs. x ista==6

- The residuals were verified for MC at beam energies of **4** and **4.5 GeV** for all targets (**Al, Cu, Pb, C**)
- The residual correction procedure was carried out using polynomials of the 5<sup>th</sup> order
- Correction the positions of the peaks of the distributions of residues in the range from **-0.01** to **+0.01 cm**
- The correction procedure did not change the width of the error (from fit pol 2+ Gaus)

Thank you for attention!
