# What is QCD?

Quantum Chromodynamics (QCD) is the theory of strong interactions of hadrons

- It is a relativistic quantum field theory based on a non-Abelian gauge group
- At a given distance, the strong interaction is stronger than the electromagnetic, weak and gravitational ones, which can be taken as perturbations; it gives account of **most of the observed matter** in the Universe
- It exhibits two kinds of fields: **quarks and gluons**; however, no isolated states of quarks and gluons have ever been seen; they are **confined into hadrons**
- At short distances ( $\lesssim 1 \text{ GeV}^{-1}$ ) the interaction is weak enough to make perturbation theory amenable (**"asymptotic freedom"**)
- There are many QCD phenomena (mechanism of confinement, nucleon structure, hadron masses, phase diagram at non-zero temperature and baryonic density, etc.) **beyond the reach of perturbative QCD**, some of them still waiting for an explanation

# Why study QCD?

- Very practical (and compelling) reason:

LHC collides protons, EIC will collide electrons and ions;  
a detailed knowledge of **proton/ion structure** and of **pure QCD background processes** is mandatory before claiming **discovery of new Physics**

- Conceptual reasons: yet **many unsolved problems**, mostly in the non-perturbative regime

- theoretical understanding of the “mass gap”

(CMI Millennium problem, 1 M\$ award:

<https://www.claymath.org/millennium-problems/>)

- nature of confinement/deconfinement transition at finite temperature

- QCD phase diagram on the temperature / baryon density plane

- proton spin

- connection to the bulk of nuclear physics

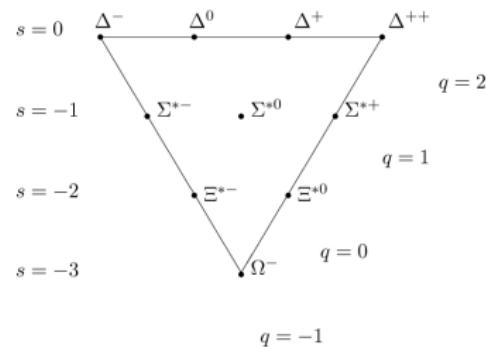

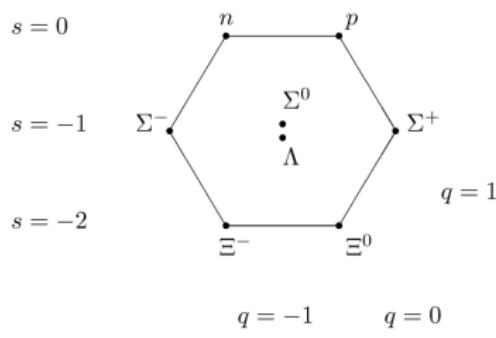

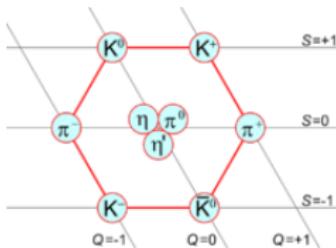

- ...

# Where was it from?

The QCD Lagrangian was proposed in 1972-1973 [Fritsch, Gell-Mann (1972); Fritsch, Gell-Mann, Leutwyler (1973)], not the culmination of a linear development process, but an ingenuous finding at the meeting point of several independent paths:

- Quark model of hadron states
- Current algebra
- Deep inelastic lepton scattering
- Theoretical development of non-Abelian gauge theories

## Quark model [Gell-Mann (1964), Zweig (1964)]

Approximate SU(3) flavor symmetry (“Three quarks for Muster Mark”, u, d, s):

- mesons ( $q\bar{q}$ ):  $3 \otimes \bar{3} = 1 \oplus 8$ ; baryons ( $qqq$ ):  $3 \otimes 3 \otimes 3 = 1 \oplus 8 \oplus 8 \oplus 10$
- mass splittings explained by an SU(3) octet perturbation

Fermi statistics:  $\Delta^{++}(S = 3/2) = |u \uparrow, u \uparrow, u \uparrow\rangle \rightarrow \epsilon_{ijk}|u_i \uparrow, u_j \uparrow, u_k \uparrow\rangle$

## Current algebra

Phenomenology:  $H_{\text{weak-strong}} = \int d^3x \sum_A j_A^\mu(x) X_{A,\mu}(x)$ ,  $X = Z, W^\pm, \gamma$

$j_A^\mu(x)$  = "conserved hadronic current"

E.g., amplitude for  $n \rightarrow p + e^- + \bar{\nu}_e \propto \langle p | j_-^\mu(0) | n \rangle \frac{-ig_{\mu\rho}}{q^2 - m_W^2} \bar{u}_e \gamma^\rho (1 - \gamma_5) v_\nu$ ,

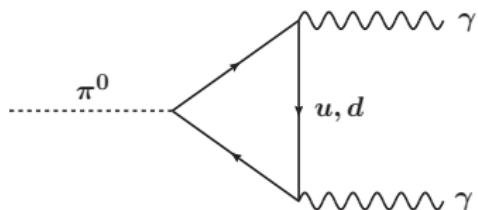

$j_-^\mu$  = "current which couples to  $W^+$ ",  $q = p_n - p_p$

Hadronic currents: (approximately) conserved currents related to chiral symmetries of strong interactions

Symmetry group:  $SU(3)_L \otimes SU(3)_R$  spontaneously broken to  $SU(3)_V$   
(or  $SU(2)_L \otimes SU(2)_R$  spontaneously broken to  $SU(2)_V$  with pions as Goldstone bosons)

In this context,  $\pi^0$  decay to  $\gamma\gamma$  should be suppressed, if not for the **anomaly of the  $U(1)_A$  symmetry** [Adler (1969); Bell, Jackiw (1969)]:

$$\Gamma(\pi^0 \rightarrow \gamma\gamma) = N_c^2 (e_u^2 - e_d^2)^2 \frac{\alpha_{\text{em}}^2 m_\pi^3}{64\pi^3 f_\pi}$$

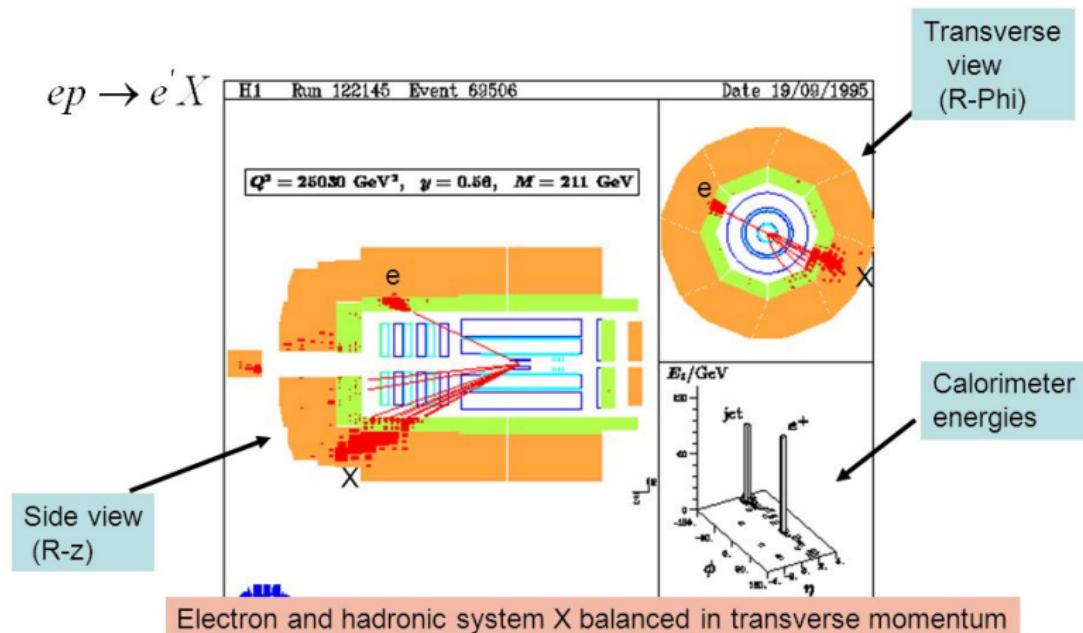

## Deep inelastic scattering (or the reality of quarks)

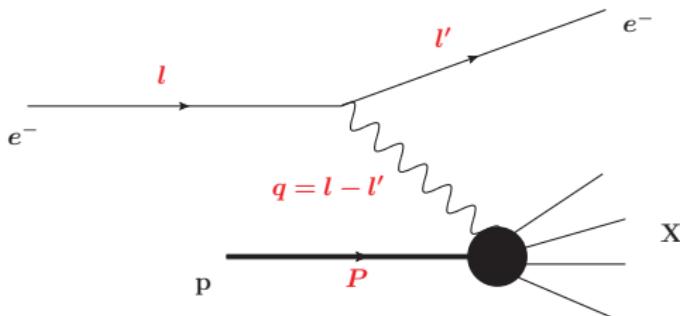

- *inclusive* process
- point-like electromagnetic probe of the proton
- pioneered at SLAC 1967-1973 ( $\simeq 21$  GeV electrons to fixed target)
- extensively studied at HERA 1992-2007 (27.5 GeV electrons, 920 GeV protons,  $\sqrt{s} = 318$  GeV)

# An H1 event display

Event : Combined view (R-z, R-Phi , calorimeter energies)

$$q^2 = (l - l')^2 \equiv -Q^2$$

$$s = (l + P)^2$$

$$\begin{aligned} m_X^2 &\equiv W^2 = (P + q)^2 \\ &= M^2 + 2P \cdot q - Q^2 \end{aligned}$$

$$x_B \equiv \frac{Q^2}{2P \cdot q}, \quad \frac{Q^2}{s+Q^2} \leq x_B \leq 1, \quad x_B = 1 \text{ elastic limit}$$

$$y \equiv \frac{q \cdot P}{l \cdot P} \simeq \frac{Q^2}{x_B s}, \quad \text{proton rest frame: } y = \frac{E - E'}{E}$$

$$\frac{m_e^2}{s}, \quad \frac{M^2}{s}, \quad \frac{M^2}{Q^2} \text{ neglected}$$

**Deep inelastic regime:**  $m_X$  and  $Q$  large,  $x_B$  fixed

$$H_{\text{em}} = \int d^3x \, e j^\mu(x) A_\mu(x), \quad j_\mu = j_\mu^{\text{lept}} + j_\mu^{\text{h}}$$

Lorentz-invariant differential cross section:

$$E' \frac{d\sigma}{d^3l'} \simeq \frac{\pi e^4}{2s} \sum_X \delta^{(4)}(p_X - P - q) \left| \langle l' | j_\mu^{\text{lept}} | l \rangle \frac{1}{q^2} \langle X | j^{\text{h},\mu} | P \rangle \right|^2 = \frac{2\alpha_{\text{em}}^2}{sQ^4} L_{\mu\nu} W^{\mu\nu}$$

$$j_\mu^{\text{lept}} = \bar{\psi}_e \gamma_\mu \psi_e + \dots, \quad L_{\mu\nu} = \frac{1}{2} \text{Tr} [\gamma_\nu \not{I} \gamma_\mu \not{I'}] = 2(l_\mu l'_\nu + l'_\mu l_\nu - g_{\mu\nu} l \cdot l')$$

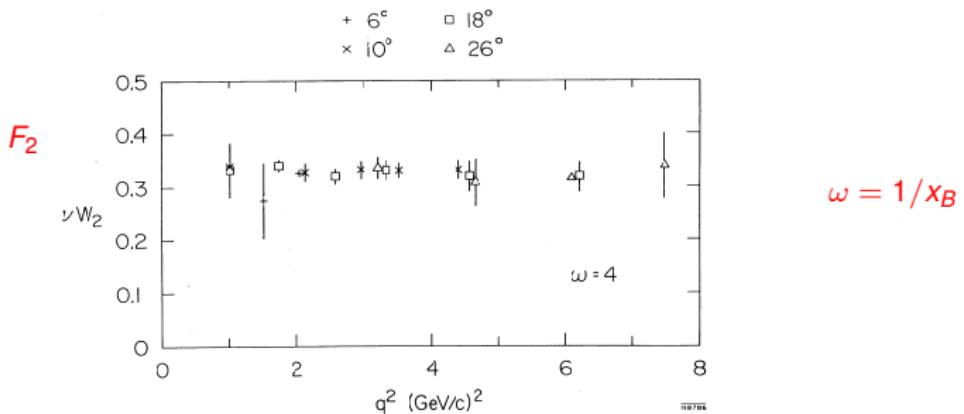

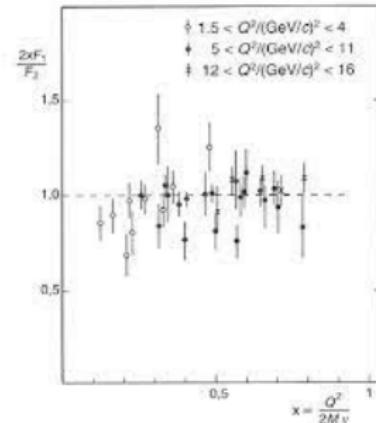

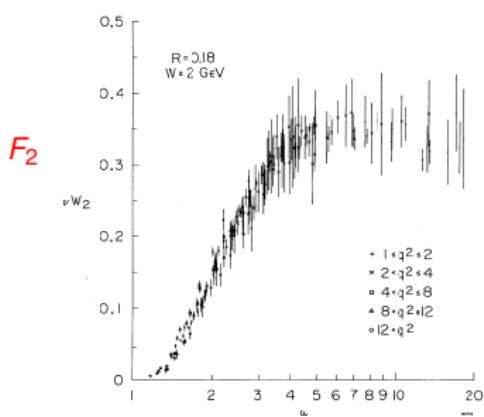

$$\begin{aligned} W_{\mu\nu} &\equiv 4\pi^3 \sum_X \delta^{(4)}(p_X - P - q) \langle P | j_\mu^h(0) | X \rangle \langle X | j_\nu^h(0) | P \rangle \\ &= \frac{1}{4\pi} \int d^4 z e^{iq \cdot z} \langle P | j_\mu^h(z) j_\nu^h(0) | P \rangle \end{aligned}$$

Current conservation, parity, hermiticity, spin average:

$$W^{\mu\nu} = \left( -g^{\mu\nu} + \frac{q^\mu q^\nu}{q^2} \right) F_1(x_B, Q^2) + \frac{\left( P^\mu - q^\mu \frac{P \cdot q}{q^2} \right) \left( P^\nu - q^\nu \frac{P \cdot q}{q^2} \right)}{P \cdot q} F_2(x_B, Q^2)$$

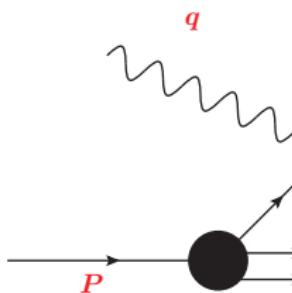

$$\begin{aligned} \frac{d\sigma}{dx_B dy} &\simeq \frac{4\pi\alpha_{\text{em}}^2}{x_B y Q^2} \left[ (1-y) F_2(x_B, Q^2) + y^2 x_B F_1(x_B, Q^2) \right] \\ &= \frac{2\pi\alpha_{\text{em}}^2}{x_B y Q^2} \left[ (1 + (1-y)^2) F_2(x_B, Q^2) - y^2 F_L(x_B, Q^2) \right], \quad F_L \equiv F_2 - 2x_B F_1 \end{aligned}$$

SLAC:  $F_i$  depend only on  $x_B$  (**Bjorken scaling**),  $F_L \simeq 0$

## Parton model [Bjorken, Paschos (1969); Feynman (1972)]

- The hard probe hits the proton on a time scale  $\sim 1/Q$ , whereas the typical interaction time within the proton is  $\sim 1/M \gg 1/Q$  in the deep inelastic regime.
- The photon interacts with the proton via **incoherent** scattering off point-like and massless **partons**, carrying a fraction  $x$  of the proton momentum and each distributed in the proton according to  $f(x)$ .

$$(xP + q)^2 \simeq 2x P \cdot q$$

$$d\sigma = \sum_i \int dx f_i(x) d\sigma_i^{\text{parton}}$$

$$W^{\mu\nu} = \sum_i \int \frac{dx}{x} f_i(x) W_i^{\text{parton}, \mu\nu}$$

Assuming massless partons with spin 1/2 and charge  $e_i e$ :

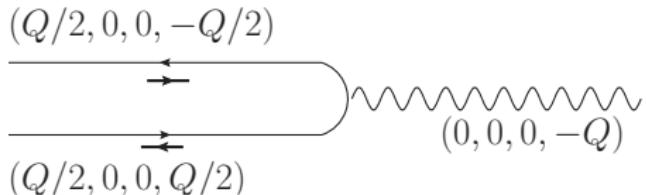

$$\begin{aligned} W_i^{\text{parton}, \mu\nu} &= e_i^2 \frac{1}{4\pi} \frac{1}{2} \text{Tr}[k \gamma^\nu (k + q) \gamma_\nu] 2\pi \delta((q + k)^2) \\ &= e_i^2 (2k^\mu k^\nu + q^\mu k^\nu + k^\mu q^\nu - g^{\mu\nu} q \cdot k) \frac{x}{Q^2} \delta(x - x_B), \quad k \equiv xP \\ \rightarrow F_2 &= \sum_i e_i^2 x_B f_i(x_B), \quad F_L = F_2 - 2x_B F_1 = 0 \end{aligned}$$

## Breit frame

QED conserves parton helicity

$$\rightarrow \Delta S = 1$$

transverse photon ( $F_L = 0$ )

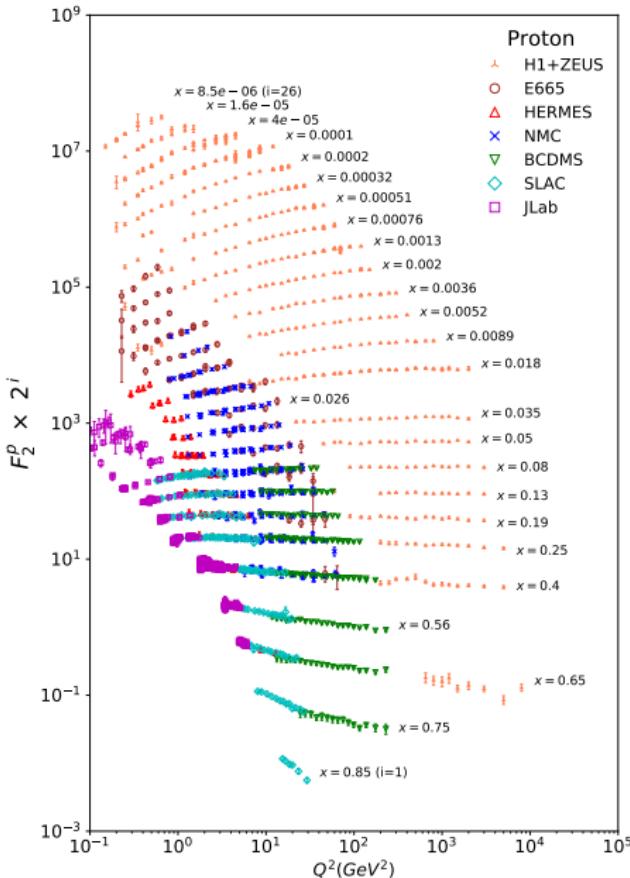

Constraints on partonic distributions:

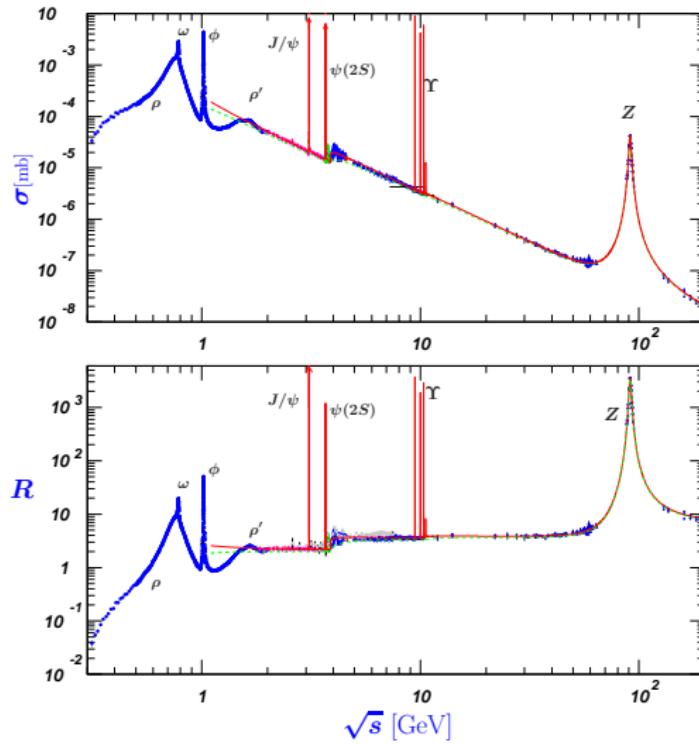

- Valence:  $\int dx (f_u(x) - f_{\bar{u}}(x)) = 2$ ,  $\int dx (f_d(x) - f_{\bar{d}}(x)) = 1$
- Strangeness:  $\int dx (f_s(x) - f_{\bar{s}}(x)) = 0$
- Charge:  
 $\frac{2}{3} \int dx (f_u(x) - f_{\bar{u}}(x)) - \frac{1}{3} \int dx (f_d(x) - f_{\bar{d}}(x)) - \frac{1}{3} \int dx (f_s(x) - f_{\bar{s}}(x)) = 1$
- Momentum:  $\sum_i \int dx x f_i(x) = 1$

if only quarks are summed, experimentally violated! **Gluons needed!**

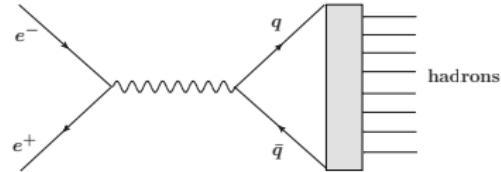

## Bjorken scaling, modern view (PDG 2020)

- Scaling violations!
  - Milder at large  $x$ , stronger at small  $x$
- The parton model must be improved!

$$R = \frac{\sigma(e^+e^- \rightarrow \text{hadrons})}{\sigma(e^+e^- \rightarrow \mu^+\mu^-)} = N_c \sum_q e_q^2$$

## Theoretical development of non-Abelian gauge theories

- Non-Abelian gauge theories [Yang, Mills (1954)]
- Quantization of Yang-Mills theories [Faddeev, Popov (1967)]
- Renormalization of Yang-Mills theories ['t Hooft (1971)]
- “Asymptotic freedom” of Yang-Mills theories ... ['t Hooft (1972); Gross, Wilczek (1973); Politzer (1973)]
- ... and only of Yang-Mills theories [Coleman, Gross (1973)]
- Which gauge symmetry?

$SU(N_c = 3)$  ... [Fritsch, Gell-Mann (1972); Fritsch, Gell-Mann, Leutwyler (1973)]

... + hypothesis that hadrons are color singlet states.

# Outline

## 1 Why QCD?

## 2 Building the theory

- QCD-improved parton model

## 4 QCD in the high-energy limit

- Semihard processes and gluon Reggeization
- BFKL approach
- LHC phenomenology - an example

## 5 Using the theory (non-perturbatively)

- General setup
- Some selected results

## 6 Conclusions

# The paradigm of gauge theories: QED

- Start from the free Dirac Lagrangian

$$\mathcal{L} = \bar{\psi}(i\cancel{D} - m)\psi$$

invariant under **global U(1)** (electric charge conservation)

$$\psi \rightarrow e^{i\theta}\psi, \quad \bar{\psi} \rightarrow e^{-i\theta}\bar{\psi}, \quad \theta \text{ constant}$$

- Promote the U(1) invariance to **local**,

$$\begin{aligned}\psi &\rightarrow e^{i\theta(x)}\psi, \quad \bar{\psi} \rightarrow e^{-i\theta(x)}\bar{\psi}, \\ \mathcal{L} &= \bar{\psi}(i\cancel{D} - m)\psi, \quad D_\mu \equiv \partial_\mu + ieA_\mu, \\ A_\mu &\rightarrow A_\mu - \frac{1}{e}\partial_\mu\theta \quad (A_\mu \text{ photon field})\end{aligned}$$

- Add a kinetic term for the photon field

$$[D_\mu, D_\nu] = ie(\partial_\mu A_\nu - \partial_\nu A_\mu) \equiv ie F_{\mu\nu}, \quad F_{\mu\nu} \text{ gauge invariant (photon neutral)}$$

$$\mathcal{L}_{\text{QED}} = \bar{\psi}(i\cancel{D} - m)\psi - \frac{1}{4}F^{\mu\nu}F_{\mu\nu},$$

which gives the correct Maxwell equations

- Start from the free Dirac Lagrangian (just one quark flavor, for the moment)

$$\mathcal{L} = \bar{\psi}(i\cancel{D} - m)\psi , \quad \psi = \begin{pmatrix} \psi_1 \\ \psi_2 \\ \psi_3 \end{pmatrix} , \quad i = 1, 2, 3 \text{ (three color states)}$$

invariant under **global SU(3)** in the **fundamental representation**

$$\psi \rightarrow U\psi , \quad U = \exp(i\theta^a t^a) \in \text{SU}(3) , \quad a = 1, \dots, 8$$

**SU(3) generators:**  $[t^a, t^b] = if^{abc}t^c$ ,  $f^{abc}$  structure constants,  $\text{Tr}(t^a t^b) = \frac{1}{2}\delta^{ab}$

- Promote the SU(3) invariance to **local** (i.e.  $\theta^a \rightarrow \theta^a(x)$ ),

$$\mathcal{L} = \bar{\psi}(i\cancel{D} - m)\psi , \quad D_\mu \equiv \partial_\mu + igA_\mu , \quad A_\mu \equiv t^a A_\mu^a$$

$$A_\mu \rightarrow U A_\mu U^{-1} + \frac{i}{g}(\partial_\mu U)U^{-1} \quad (A_\mu^a, a = 1, \dots, 8, \text{ gluon fields})$$

- Add a kinetic term for the gluon fields

$$[D_\mu, D_\nu] = igF_{\mu\nu} , \quad F_{\mu\nu} = t^a F_{\mu\nu}^a , \quad F_{\mu\nu}^a = \partial_\mu A_\nu^a - \partial_\nu A_\mu^a - g f^{abc} A_\mu^b A_\nu^c ,$$

$F_{\mu\nu}^a$  are not gauge invariant:  $F_{\mu\nu} \rightarrow UF_{\mu\nu}U^{-1}$

$$\mathcal{L}_{\text{QCD}} = \bar{\psi}(i\cancel{D} - m)\psi - \frac{1}{2}\text{Tr}(F^{\mu\nu} F_{\mu\nu}) \quad \text{3- and 4-gluon interaction terms here}$$

## Remarks

- a mass term for the gluon field  $A^{a,\mu} A_\mu^a$  would break gauge invariance
- all terms in  $\mathcal{L}_{\text{QCD}}$  have dimension four, due to

$$[\psi] = M^{3/2}, \quad [A_\mu^a] = M, \quad [\partial_\mu] = M, \quad [g] = M^0$$

Lorentz- and gauge-invariant terms such as  $(\text{Tr}(F^{\mu\nu} F_{\mu\nu}))^2$  or similar would spoil renormalizability

- a term of the form  $\mathcal{L}_\theta = \theta \frac{g^2}{32\pi^2} \epsilon_{\mu\nu\rho\sigma} F^{a,\mu\nu} F^{a,\rho\sigma}$  cannot be excluded

$\mathcal{L}_\theta \propto \vec{E}^a \cdot \vec{B}^a$  and therefore breaks parity (P) and time reversal (T)  
(recall:  $\vec{E}$  is P-odd and T-even,  $\vec{B}$  is P-even and T-odd)

Current upper bounds on the electric neutron moment impose  $\theta \lesssim 10^{-10}$ .

# QCD - Classical symmetries

Extension to many flavors:  $\bar{\psi}(i\cancel{D} - m)\psi \longrightarrow \sum_{f=1}^{N_f=6} \bar{\psi}_f(i\cancel{D} - m_f)\psi_f$

- With no information about masses,  $\mathcal{L}_{\text{QCD}}$  is invariant under  $\psi_f \rightarrow e^{i\alpha_f} \psi_f$

exact symmetry:  $U(1)_u \otimes U(1)_d \otimes U(1)_s \otimes U(1)_c \otimes U(1)_b \otimes U(1)_t$

each flavor is conserved separately

$$0 = \delta \mathcal{L} = \partial_\mu j^\mu, \quad j^\mu = \frac{\partial \mathcal{L}}{\partial (\partial_\mu \psi_f)} \delta \psi_f \propto \bar{\psi}_f \gamma^\mu \psi_f$$

- Light quarks:  $m_u \sim 2 - 4 \text{ MeV}$ ,  $m_d \sim 3 - 5 \text{ MeV}$ ,  $m_s \sim 100 \text{ MeV}$  [PDG 2020]

$$\mathcal{L}_F^{(ud)} = \bar{\psi}(i\cancel{D} - M)\psi, \quad \psi = \begin{pmatrix} \psi_u \\ \psi_d \end{pmatrix}, \quad M = \begin{pmatrix} m_u & 0 \\ 0 & m_d \end{pmatrix},$$

approximate (good) symmetry:  $U(2) = \underbrace{U(1)}_{\text{baryon no.}} \otimes \underbrace{SU(2)}_{\text{isospin}}$

$$\mathcal{L}_F^{(uds)} = \bar{\psi}(i\cancel{D} - M)\psi, \quad \psi = \begin{pmatrix} \psi_u \\ \psi_d \\ \psi_s \end{pmatrix}, \quad M = \begin{pmatrix} m_u & 0 & 0 \\ 0 & m_d & 0 \\ 0 & 0 & m_s \end{pmatrix},$$

approximate symmetry:  $U(3) = \underbrace{U(1)}_{\text{baryon no.}} \otimes \underbrace{SU(3)}_{\text{isospin}}$

- $m_{u,d} \ll$  “typical hadron mass” (barely true also for  $m_s$ ):

assume  $m_l = 0$  for  $l = u, d$  ( $L_f = 2$ ) or even for  $l = u, d, s$  ( $L_f = 3$ ) (chiral limit)

$$\psi_{R,L} = \frac{1 \pm \gamma_5}{2} \psi \equiv P_{R,L} \psi , \quad \gamma_5 = i\gamma^0\gamma^1\gamma^2\gamma^3$$

$$\mathcal{L}_F^{(L_f)} = \bar{\psi}_R(i\cancel{D})\psi_R + \bar{\psi}_L(i\cancel{D})\psi_L - \bar{\psi}_R M \psi_L - \bar{\psi}_L M \psi_R , \quad M \text{ mass matrix } L_f \times L_f$$

for  $M \rightarrow 0$ , symmetry:  $U(L_f)_L \otimes U(L_f)_R = \underbrace{U(1)_L \otimes U(1)_R}_{U(1)_V \otimes U(1)_A} \otimes \underbrace{SU(L_f)_L \otimes SU(L_f)_R}_{SU(L_f)_V \otimes SU(L_f)_A}$

$$U(1)_L : \psi_L \rightarrow e^{i\theta_L} \psi_L , \quad U(1)_R : \psi_R \rightarrow e^{i\theta_R} \psi_R ,$$

$$U(1)_V : \psi \rightarrow e^{i\theta} \psi , \quad U(1)_A : \psi \rightarrow e^{i\tilde{\theta}\gamma_5} \psi$$

$$SU(L_f)_L : \psi_L \rightarrow e^{i\theta_L^a t^a} \psi_L , \quad SU(L_f)_R : \psi_R \rightarrow e^{i\theta_R^a t^a} \psi_R ,$$

$$SU(L_f)_V : \psi \rightarrow e^{i\theta^a t^a} \psi , \quad SU(L_f)_A : \psi \rightarrow e^{i\tilde{\theta}^a t^a \gamma_5} \psi$$

- (Classically) conserved currents:

$$\begin{array}{ll}
 \underbrace{U(1)_V}_{\text{baryon no.}} : j_V^\mu = \sum_{i=1}^{L_f} \bar{\psi}_i \gamma^\mu \psi_i , & \underbrace{U(1)_A}_{\text{anomalous}} : j_5^\mu = \sum_{i=1}^{L_f} \bar{\psi}_i \gamma^\mu \gamma_5 \psi_i , \\
 \underbrace{SU(L_f)_V}_{\text{isospin}} : j_V^{a,\mu} = \sum_{i=1}^{L_f} \bar{\psi}_i \gamma^\mu t^a \psi_i , & \underbrace{SU(L_f)_A}_{\text{spont. broken}} : j_A^{a,\mu} = \sum_{i=1}^{L_f} \bar{\psi}_i \gamma^\mu \gamma_5 t^a \psi_i
 \end{array}$$

$$\partial_\mu j_V^\mu = \delta \mathcal{L}_F^{(L_f)} = 0$$

$$\partial_\mu j_A^\mu = \delta \mathcal{L}_F^{(L_f)} = 2i\bar{\psi}\gamma_5 M\psi + \text{quantum anomaly}$$

$$\partial_\mu j_V^{a,\mu} = \delta \mathcal{L}_F^{(L_f)} = i \sum_{i,j} (m_i - m_j) \bar{\psi}_i t_{ij}^a \psi_j$$

$$\partial_\mu j_A^{a,\mu} = \delta \mathcal{L}_F^{(L_f)} = i \sum_{i,j} (m_i + m_j) \bar{\psi}_i t_{ij}^a \psi_j$$

$$\text{quantum anomaly} = L_f \frac{g^2}{16\pi^2} \epsilon_{\mu\nu\rho\sigma} F^{a,\mu\nu} F^{a,\rho\sigma}$$

# Outline

## 1 Why QCD?

## 2 Building the theory

- Classical Lagrangian and its symmetries

## 4 QCD in the high-energy limit

- Semihard processes and gluon Reggeization
- BFKL approach
- LHC phenomenology - an example

## 5 Using the theory (non-perturbatively)

- General setup
- Some selected results

## 6 Conclusions

# Quantization

- Let's start again from QED:

$$\mathcal{L}_{\text{QED}} = \bar{\psi}(i\not{D} - m)\psi - \frac{1}{4}F^{\mu\nu}F_{\mu\nu}, \quad F^{\mu\nu} = \partial^\mu A^\nu - \partial^\nu A^\mu$$

Not suitable for quantization:  $\Pi^\mu = \frac{\partial \mathcal{L}_{\text{QED}}}{\partial(\partial_0 A_\mu)} = -F^{0\mu} \rightarrow \Pi^0 = 0$

Solution: **gauge fixing!** (different gauges lead to the same physics).

**Covariant gauges:**  $\Delta \mathcal{L}_{\text{QED}} = -\frac{1}{2\xi}(\partial_\mu A^\mu)^2$  (Maxwell theory +  $\partial_\mu A^\mu = 0$ ).

Photon propagator:  $D^{\mu\nu}(k) = \frac{i}{k^2} \left( -g^{\mu\nu} + (1 - \xi) \frac{k^\mu k^\nu}{k^2} \right)$

- Ward identity:** process with incoming photon, **no matter other external particles**

$$\mathcal{M} = \epsilon_\mu(k) \mathcal{M}^\mu = \underbrace{(\epsilon_\mu(k) + \alpha k_\mu)}_{\text{gauge transformation}} \mathcal{M}^\mu, \quad \rightarrow k_\mu \mathcal{M}^\mu = 0$$

Say  $k^\mu = (k, 0, 0, k)$ , then  $0 = k_\mu \mathcal{M}^\mu = k(\mathcal{M}^0 - \mathcal{M}^3) \rightarrow \mathcal{M}^0 = \mathcal{M}^3$

$$\sum_{\text{pol.}} |\mathcal{M}|^2 = \underbrace{\sum_{\text{pol.}} \epsilon_\mu(k) \epsilon_\nu^*(k) \mathcal{M}^\mu \mathcal{M}^{*\nu}}_{-g_{\mu\nu}} = -(|\cancel{\mathcal{M}^0}|^2 - |\mathcal{M}^1|^2 - |\mathcal{M}^2|^2 - |\cancel{\mathcal{M}^3}|^2)$$

only transverse photons matter!

- In QCD, covariance gauge fixing by  $\Delta\mathcal{L}_{\text{QCD}} = -\frac{1}{2\xi}(\partial_\mu A^{a,\mu})^2$  is not enough.

Unphysical gluon degrees of freedom are not automatically cancelled in cross sections and in internal loops.

- Extra fields: Faddeev-Popov ghosts

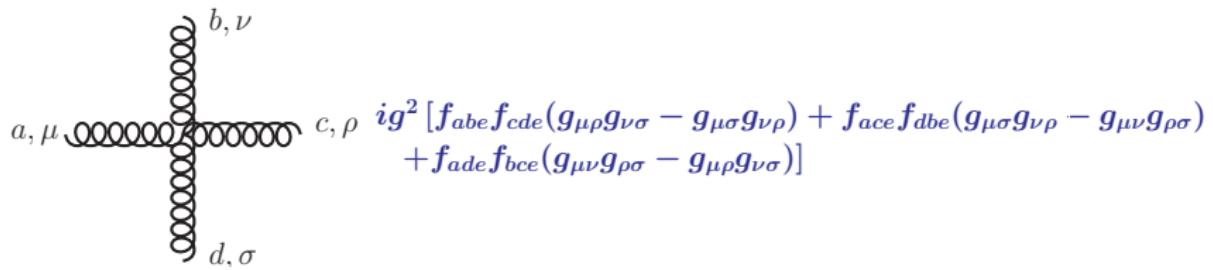

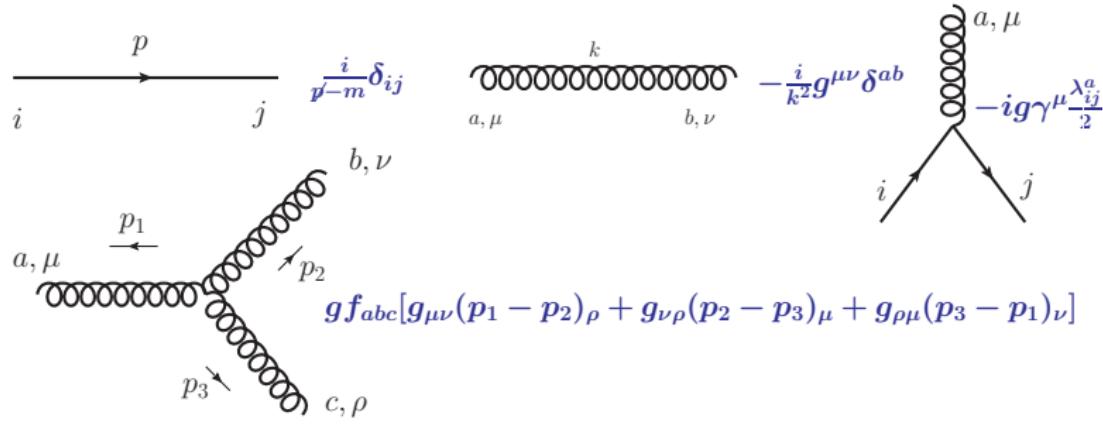

$$\Delta\mathcal{L}_{\text{QCD}} = -\frac{1}{2\xi}(\partial_\mu A^{a,\mu})^2 + \partial_\mu \eta^{a\dagger} \underbrace{(\partial^\mu \delta^{ab} + g f_{abc} A^{c,\mu}) \eta^b}_{\equiv D_{ab}^\mu}$$

They anti-commute as fermionic fields, but propagate as bosonic ones

- In physical gauges,  $n \cdot A^a = 0$ , there are no ghosts, but the gluon propagator takes the form

$$D^{ab,\mu\nu}(k) = \delta^{ab} \frac{i}{k^2} \left( -g^{\mu\nu} + \frac{k^\mu n^\nu + n^\mu k^\nu}{n \cdot k} - (n^2 + \xi k^2) \frac{k^\mu k^\nu}{(n \cdot k)^2} \right)$$

## QCD Feynman rules - Covariant gauge, $\xi = 1$

$$\lambda_1 = \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \lambda_2 = \begin{pmatrix} 0 & -i & 0 \\ i & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \quad \lambda_3 = \begin{pmatrix} 1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 0 \end{pmatrix},$$

$$\lambda_4 = \begin{pmatrix} 0 & 0 & 1 \\ 0 & 0 & 0 \\ 1 & 0 & 0 \end{pmatrix}, \quad \lambda_5 = \begin{pmatrix} 0 & 0 & -i \\ 0 & 0 & 0 \\ i & 0 & 0 \end{pmatrix},$$

$$\lambda_6 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}, \quad \lambda_7 = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & -i \\ 0 & i & 0 \end{pmatrix}, \quad \lambda_8 = \frac{1}{\sqrt{3}} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -2 \end{pmatrix},$$

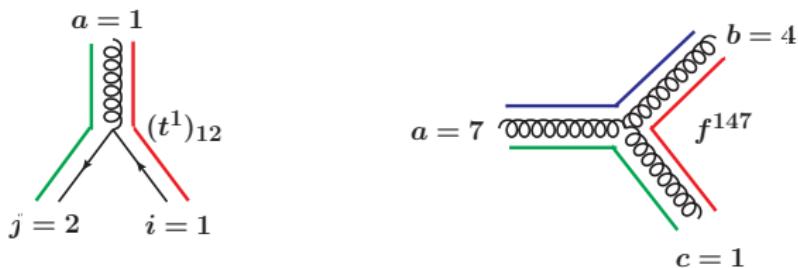

$$t^a = \frac{\lambda^a}{2}$$

$$\text{Tr} \left( \frac{\lambda^a}{2} \frac{\lambda^b}{2} \right) = \frac{\delta^{ab}}{2}, \quad \left[ \frac{\lambda^a}{2}, \frac{\lambda^b}{2} \right] = i \epsilon^{abc} \frac{\lambda^c}{2},$$

$$f_{123} = 1, \quad f_{458} = f_{678} = \sqrt{3}/2, \quad f_{147} = f_{165} = f_{246} = f_{345} = f_{376} = f_{257} = 1/2$$

$$|R\rangle \doteq \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \quad |G\rangle \doteq \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}, \quad |B\rangle \doteq \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$$

$$\begin{aligned}\lambda_1 &= |G\rangle\langle R| + |R\rangle\langle G|, \quad \lambda_2 = i|G\rangle\langle R| - i|R\rangle\langle G|, \quad \lambda_3 = |R\rangle\langle R| - |G\rangle\langle G|, \\ \lambda_4 &= |B\rangle\langle R| + |R\rangle\langle B|, \quad \lambda_5 = i|B\rangle\langle R| - i|R\rangle\langle B|, \\ \lambda_6 &= |B\rangle\langle G| + |G\rangle\langle B|, \quad \lambda_7 = i|B\rangle\langle G| - i|G\rangle\langle B|, \\ \lambda_8 &= \frac{1}{\sqrt{3}}|R\rangle\langle R| + \frac{1}{\sqrt{3}}|G\rangle\langle G| - \frac{2}{\sqrt{3}}|B\rangle\langle B|\end{aligned}$$

$$(0 \quad \textcolor{red}{1} \quad 0) \underbrace{\begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix}}_{\lambda_1} \begin{pmatrix} \textcolor{red}{1} \\ 0 \\ 0 \end{pmatrix}$$

- Quark (say, red colored) splitting to quark-gluon

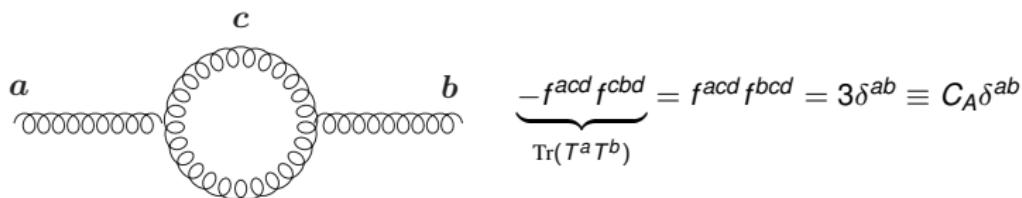

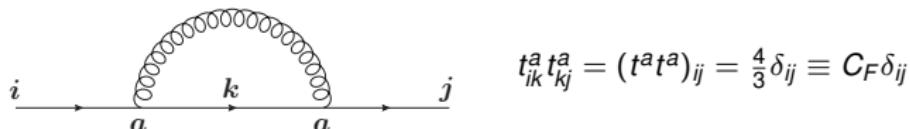

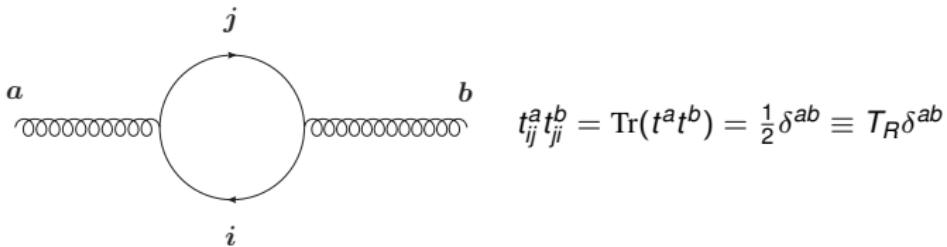

$$\begin{aligned}
 \text{Prob}(R \rightarrow qg) &= \text{Prob}(R \rightarrow R) + \text{Prob}(R \rightarrow G) + \text{Prob}(R \rightarrow B) \\
 &= |\langle R | \frac{\lambda_3}{2} | R \rangle|^2 + |\langle R | \frac{\lambda_8}{2} | R \rangle|^2 \\
 &\quad + |\langle G | \frac{\lambda_1}{2} | R \rangle|^2 + |\langle G | \frac{\lambda_2}{2} | R \rangle|^2 \\
 &\quad + |\langle B | \frac{\lambda_4}{2} | R \rangle|^2 + |\langle B | \frac{\lambda_5}{2} | R \rangle|^2 = \dots = \frac{4}{3} \equiv C_F \left( = \frac{N_c^2 - 1}{2N_c} \right)
 \end{aligned}$$

- Gluon (say, no. 1) splitting to gluon-gluon

$$\begin{aligned}
 \text{Prob}(1 \rightarrow gg) &= 2(\text{Prob}(1 \rightarrow 2+3) + \text{Prob}(1 \rightarrow 4+7) + \text{Prob}(1 \rightarrow 5+6)) \\
 &= 2(f_{123}^2 + f_{147}^2 + f_{156}^2) = 3 \equiv C_A (= N_c)
 \end{aligned}$$

- Gluon (say, no. 1) splitting to quark-antiquark

$$\text{Prob}(1 \rightarrow q\bar{q}) = \left| \frac{\lambda_{12}^1}{2} \right|^2 + \left| \frac{\lambda_{21}^1}{2} \right|^2 = \frac{1}{2} \equiv T_R$$

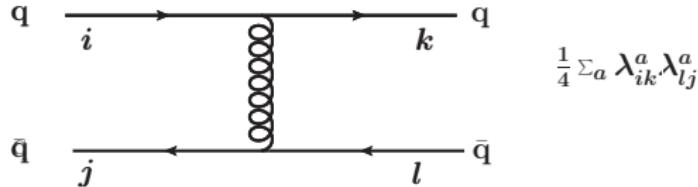

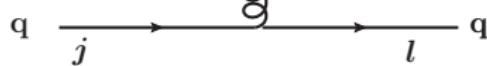

$$t^a \equiv \frac{\lambda^a}{2}, \quad T_{bc}^a = i f_{abc}$$

$$C_A = N_c, \quad C_F = \frac{N_c^2 - 1}{2N_c}, \quad C_A > C_F$$

Gluon charge is larger than quark charge!

- quark-quark and quark-antiquark scattering

- Examples:

$$qq, \text{ same color, } RR \rightarrow RR : \quad \frac{1}{4} \left( \frac{\lambda_{11}^3}{2} \frac{\lambda_{11}^3}{2} + \frac{\lambda_{11}^8}{2} \frac{\lambda_{11}^8}{2} \right) = \frac{1}{4} \left( 1 + \frac{1}{3} \right) = \frac{1}{3}$$

$$qq, \text{ two colors (no swap), } RB \rightarrow RB : \quad \frac{1}{4} \frac{\lambda_{11}^8}{2} \frac{\lambda_{33}^8}{2} = \frac{1}{4} \frac{1}{\sqrt{3}} \frac{-2}{\sqrt{3}} = -\frac{1}{6}$$

$$qq, \text{ two (with swap), } RG \rightarrow GR : \quad \frac{1}{4} \left( \frac{\lambda_{12}^1}{2} \frac{\lambda_{21}^1}{2} + \frac{\lambda_{12}^2}{2} \frac{\lambda_{21}^2}{2} \right) = \frac{1}{4}(1+1) = \frac{1}{2}$$

$$qq, \text{ three colors colors, } RB \rightarrow RG : \quad 0 \text{ (color conservation)}$$

- Further examples:

$q\bar{q}$ , same as  $qq$ , just pay attention to position of color indices,

$$\underbrace{\sum_a \lambda_{ik}^a \lambda_{jl}^a}_{qq} \longrightarrow \underbrace{\sum_a \lambda_{ik}^a \lambda_{lj}^a}_{q\bar{q}}$$

A useful shortcut,  $\sum_a \frac{\lambda_{ik}^a}{2} \frac{\lambda_{jl}^a}{2} = \frac{1}{2} \left( \delta_{il}\delta_{kj} - \frac{1}{N_c} \delta_{ik}\delta_{jl} \right)$

- Problem: consider the  $q\bar{q}$  scattering by one-gluon exchange for a pair in the

1) singlet state,  $\frac{1}{\sqrt{3}} (|R\bar{R}\rangle + |G\bar{G}\rangle + |B\bar{B}\rangle)$

2) in an octet state, e.g.  $|R\bar{G}\rangle$ .

Show, by comparison with the known attractive  $e^+e^-$  scattering by one-photon exchange, that case 1) is **attractive**, case 2) is **repulsive**.

## 6 Conclusions

# Renormalization

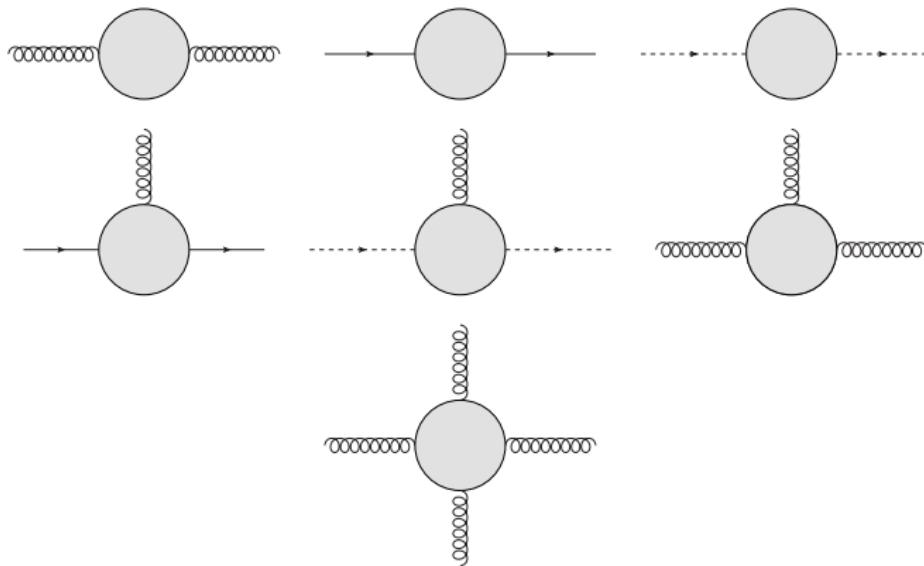

E.g., quark self-energy (up to a color factor):

$$-g^2 \int \frac{d^4 k}{(2\pi)^4} \frac{\gamma^\mu (p - k + m) \gamma_\mu}{[(p - k)^2 - m^2] k^2}$$

divergent for large  $k$ , by power counting  
(ultraviolet divergence)

Processes where UV divergences appear in QCD

- **Regularization**: gives meaning to div. integrals, by cutting-off large momenta

Most commonly: **dimensional regularization** (space-time dimension  $D$ ).

E.g.,  $I(n) \equiv \int \frac{d^4 k}{(2\pi)^4} \frac{1}{(k^2 - s)^n}$  does not exist for  $n \leq 2$ ,

but  $I_D(n) \equiv \int \frac{d^D k}{(2\pi)^D} \frac{1}{(k^2 - s)^n}$  does exist for  $n > D/2$ ,

$I_D(n) = i \frac{(-1)^n}{\Gamma(n)} \frac{1}{(4\pi)^{D/2}} \frac{\Gamma(n-D/2)}{s^{n-D/2}}$ , analytically continued to all complex values  $D$

The divergence for  $D \rightarrow 4$  resurfaces as pole in  $\epsilon \equiv \frac{4-D}{2}$ , e.g.

$$I_D(n=2) = \frac{i}{(4\pi)^{D/2}} \frac{\Gamma(2-D/2)}{s^{2-D/2}} = \frac{i}{(4\pi)^{2-\epsilon}} \frac{\Gamma(\epsilon)}{s^\epsilon}, \quad \Gamma[\epsilon] = \frac{1}{\epsilon} - \gamma_E + \mathcal{O}(\epsilon)$$

- Dimensional analysis:

$$[\mathcal{L}] = M^D, \quad [A_\mu^a] = M^{\frac{D-2}{2}}, \quad [\psi] = M^{\frac{D-1}{2}} \quad \rightarrow \quad [g] = M^{\frac{4-D}{2}} = M^\epsilon$$

To keep working with a dimensionless coupling, redefine  $g$  as  $g\mu^\epsilon$ .

$\mu$  is an **arbitrary mass scale**.

- Re-normalize fields and parameters (original ones labeled by  $(0)$ ):

$$A^{(0)} = Z_A^{1/2} A, \quad \psi^{(0)} = Z_\psi^{1/2} \psi, \quad \eta^{(0)} = Z_\eta^{1/2} \eta,$$

$$m^{(0)} = Z_m m, \quad g^{(0)} = Z_g g, \quad \xi^{(0)} = Z_A \xi$$

Each term in  $\mathcal{L}_{\text{QCD}}$  can be recast as follows:

$$\bar{\psi}^{(0)} i \not{\partial} \psi^{(0)} = Z_\psi \bar{\psi} i \not{\partial} \psi = \bar{\psi} i \not{\partial} \psi + \underbrace{(Z_\psi - 1) \bar{\psi} i \not{\partial} \psi}_{\text{counterterm}}$$

$$g^{(0)} \bar{\psi}^{(0)} A^{(0)} \psi^{(0)} = \underbrace{Z_g Z_\psi Z_A^{1/2}}_{Z_{A \bar{\psi} \psi}} g \bar{\psi} A \psi = g \bar{\psi} A \psi + \underbrace{(Z_{A \bar{\psi} \psi} - 1) g \bar{\psi} A \psi}_{\text{counterterm}}$$

...

$$\mathcal{L}_{\text{QCD}}[\psi^{(0)}, A^{(0)}, \eta^{(0)}, m^{(0)}, g^{(0)}, \xi^{(0)}] = \underbrace{\mathcal{L}_{\text{QCD}}[\psi, A, \eta, m, g, \xi]}_{\text{same form as original}} + \underbrace{\mathcal{L}_{\text{counterterms}}}_{\text{extra interactions}}$$

- Cancel  $\epsilon$ -poles in divergent “processes”, order by order in perturbation theory, by suitably choosing  $Z_\psi, Z_A, Z_\eta, Z_{m \bar{\psi} \psi}, Z_{A \bar{\psi} \psi}, Z_{A \bar{\eta} \eta}, Z_{A^3}, Z_{A^4}$ .

**MS** scheme: subtract not just  $\frac{1}{\epsilon}$ , but  $\frac{1}{\epsilon} + \ln(4\pi) - \gamma_E$ .

- In particular, determine  $Z_g$ :

$$g^{(0)} = Z_g g \mu^\epsilon, \quad Z_g = \frac{Z_{A\bar{\psi}\psi}}{Z_A^{1/2} Z_\psi} = \frac{Z_{A\bar{\eta}\eta}}{Z_A^{1/2} Z_\eta} = \frac{Z_{A^3}}{Z_A^{3/2}} = \sqrt{\frac{Z_{A^4}}{Z_A^2}}$$

[Taylor (1971); Slavnov (1972)]

**MS** scheme:

$$Z_g = 1 + \frac{\alpha_s}{4\pi} \frac{1}{\epsilon} \left[ \frac{2}{3} T_R n_f - \frac{11}{6} C_A \right] + \mathcal{O}(\alpha_s^2) \equiv 1 + \frac{\beta_0}{\epsilon} \frac{\alpha_s}{2} + \mathcal{O}(\alpha_s^2), \quad \alpha_s \equiv \frac{g^2}{4\pi}$$

$n_f$  is the number of “light” quarks, i.e. quarks with  $m_q \ll \mu$

- The (dimensionless) renormalized coupling  $g$  evidently depends on  $\mu$ . How?

$$\beta(g) \equiv \mu \frac{\partial g}{\partial \mu}, \quad 0 = \mu \frac{dg^{(0)}}{d\mu} = \mu \frac{d(Z_g g \mu^\epsilon)}{d\mu}$$

$$\rightarrow \beta(g) = -\epsilon g - \frac{\mu}{Z_g} \frac{\partial Z_g}{\partial \mu} g = -\epsilon g - \beta_0 \frac{g^2}{4\pi} \frac{\beta(g)}{\epsilon} + \mathcal{O}(g^5) = -\beta_0 \frac{g^3}{4\pi} + \mathcal{O}(g^5, \epsilon)$$

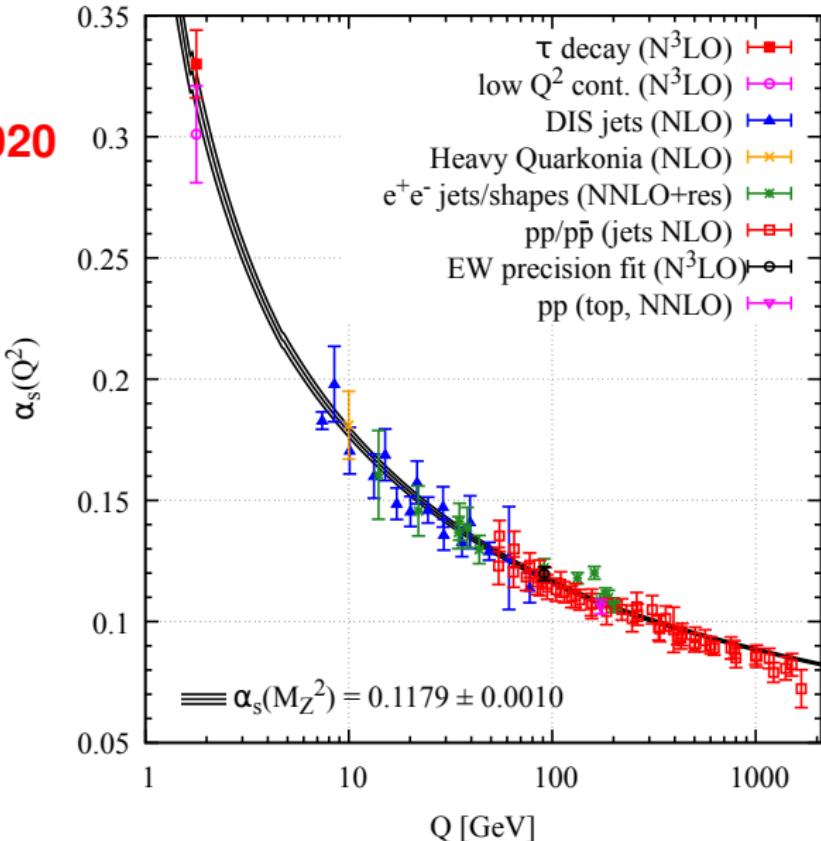

$$\beta(\alpha_s) \equiv \mu^2 \frac{\partial \alpha_s}{\partial \mu^2} = -\alpha_s^2 \beta_0 + \mathcal{O}(\alpha_s^3)$$

$$\frac{1}{\alpha_s(\mu^2)} = \frac{1}{\alpha_s(\mu_0^2)} + \beta_0 \ln \frac{\mu^2}{\mu_0^2} \quad \text{or} \quad \alpha_s(\mu^2) = \frac{1}{\beta_0 \ln \frac{\mu^2}{\Lambda_{\text{QCD}}^2}}$$

“Dimensional transmutation”

$$\beta(\alpha_s) = -\alpha_s^2(\beta_0 + \beta_1\alpha_s + \beta_2\alpha_s^2 + \beta_3\alpha_s^3 + \beta_4\alpha_s^4 + \dots)$$

PDG2020

# Renormalization group - an example

Let's consider again  $R = \frac{\sigma(e^+e^- \rightarrow \text{hadrons})}{\sigma(e^+e^- \rightarrow \mu^+\mu^-)}$ , up to an irrelevant normalization:

$$R\left(\frac{Q^2}{\mu^2}, \alpha_s(\mu^2)\right) = 1 + \sum_{n=1}^{\infty} r_n(Q^2/\mu^2) \alpha_s^n(\mu^2), \quad Q^2 \text{ squared c.o.m. energy}$$

$$\begin{aligned} 0 &= \mu^2 \frac{d}{d\mu^2} R\left(\frac{Q^2}{\mu^2}, \alpha_s(\mu^2)\right) = \left[ \mu^2 \frac{\partial}{\partial \mu^2} + \beta(\alpha_s) \frac{\partial}{\partial \alpha_s} \right] R\left(\frac{Q^2}{\mu^2}, \alpha_s(\mu^2)\right) \\ &= \mu^2 \frac{dr_1}{d\mu^2} \alpha_s + \left( \mu^2 \frac{dr_2}{d\mu^2} - r_1 \beta_0 \right) \alpha_s^2 + \left( \mu^2 \frac{dr_3}{d\mu^2} - 2r_2 \beta_0 - r_1 \beta_1 \right) \alpha_s^3 + \dots \end{aligned}$$

$$r_1 = c_1, \quad r_2 = c_2 + c_1 \beta_0 t, \quad r_3 = c_3 + (2c_2 \beta_0 + c_1 \beta_1)t + c_1 \beta_0 t^2, \quad t \equiv \ln \frac{\mu^2}{Q^2}$$

$$\begin{aligned} R(t, \alpha_s) &= 1 + c_1(1 + \beta_0 \alpha_s t + (\beta_0 \alpha_s t)^2 + \dots) \alpha_s + c_2 \alpha_s^2 + \dots \\ &= 1 + c_1 \frac{\alpha_s(\mu^2)}{1 + \beta_0 \alpha_s(\mu^2) \ln \frac{Q^2}{\mu^2}} + \dots \end{aligned}$$

The choice  $\mu = Q$  removes (possibly large) logarithms from the perturbative series:

$$R(1, \alpha_s(Q^2)) = 1 + c_1 \alpha_s(Q^2) + c_2 \alpha_s^2(Q^2) + \dots$$

$\mu = Q$  not always the best choice, due to **truncation**: the first unknown  $c_i$  can be large.

In many applications, results are quoted for  $\mu$  ranging in the interval  $[\frac{Q}{2}, 2Q]$ .

**Optimization procedures** have been designed to fix the  $\mu$  scale.

Take  $R$  truncated at the order  $\alpha_s^2$ :

$$R^{(2)} \left( \frac{Q^2}{\mu^2}, \alpha_s(\mu^2) \right) = 1 + c_1 \alpha_s(\mu^2) + \left[ c_2 - c_1 \beta_0 \ln \frac{Q^2}{\mu^2} \right] \alpha_s^2(\mu^2)$$

1) Principle of Minimum Sensitivity [Stevenson (1981)]

$$\mu^2 \frac{d}{d\mu^2} R^{(2)}(\mu^2) \Big|_{\mu_{\text{PMS}}^2} = 0 \quad \rightarrow \quad \mu_{\text{PMS}}^2 = Q^2 \exp \left( -\frac{c_2}{\beta_0 c_1} - \frac{\beta_1}{2\beta_0^2} \right)$$

2) Fast apparent convergence [Grunberg (1980)]

$$R^{(1)}(\mu_{\text{FAC}}^2) = R^{(2)}(\mu_{\text{FAC}}^2) \quad \rightarrow \quad \mu_{\text{FAC}}^2 = Q^2 \exp \left( -\frac{c_2}{\beta_0 c_1} \right)$$

3) BLM procedure [Brodsky, Lepage, Mackenzie (1983)]

choose  $\mu$  so to remove the  $n_f$  dependence in the perturbative coefficients

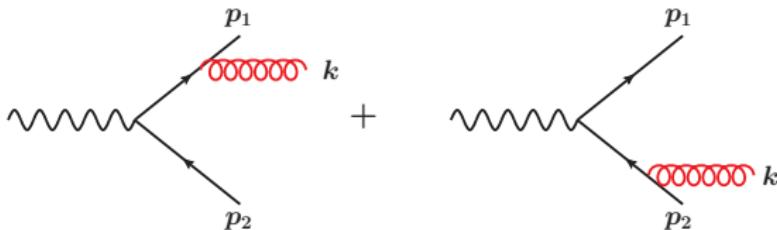

# Outline

- 6 Conclusions

# Infrared divergences

Consider (again)  $e^+ + e^- \rightarrow \gamma^* \rightarrow \text{hadrons}$ , including QCD effects up to  $\mathcal{O}(\alpha_s)$

## Real corrections: gluon emission

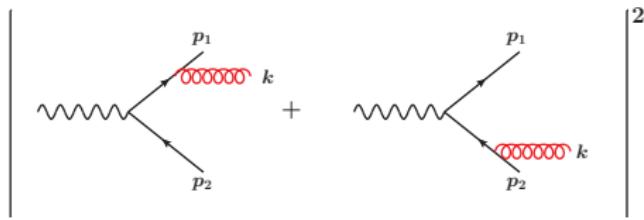

$$\mathcal{M}_{q\bar{q}g}^\mu = \bar{u}(p_1) \left[ (-igt^a \not{\epsilon}(k)) i \frac{\not{p}_1 + \not{k}}{(p_1 + k)^2} (-ie_q \gamma^\mu) + (-ie_q \gamma^\mu) i \frac{-\not{p}_2 - \not{k}}{(p_2 + k)^2} (-igt^a \not{\epsilon}(k)) \right] v(p_2)$$

Soft limit,  $k \rightarrow 0$ , plus Dirac equation ( $\bar{u}(p_1) \not{p}_1 = 0 = \not{p}_2 v(p_2)$ , massless quarks)

$$\mathcal{M}_{q\bar{q}g}^\mu \simeq \underbrace{\bar{u}(p_1) (-ie_q \gamma^\mu) v(p_2)}_{\mathcal{M}_{q\bar{q}}^\mu} (gt^a) \left( \frac{\not{p}_1 \cdot \epsilon}{\not{p}_1 \cdot k} - \frac{\not{p}_2 \cdot \epsilon}{\not{p}_2 \cdot k} \right)$$

$$H_{q\bar{q}g}^{\mu\nu} \simeq \sum_{\text{color, pol}} \mathcal{M}_{q\bar{q}}^\mu (\mathcal{M}_{q\bar{q}}^\nu)^* \left| (gt^a) \left( \frac{\not{p}_1 \cdot \epsilon}{\not{p}_1 \cdot k} - \frac{\not{p}_2 \cdot \epsilon}{\not{p}_2 \cdot k} \right) \right|^2$$

$$= -H_{q\bar{q}}^{\mu\nu} C_F g^2 \left( \frac{\not{p}_1}{\not{p}_1 \cdot k} - \frac{\not{p}_2}{\not{p}_2 \cdot k} \right)^2 = H_{q\bar{q}}^{\mu\nu} C_F g^2 \frac{2\not{p}_1 \cdot \not{p}_2}{(\not{p}_1 \cdot k)(\not{p}_2 \cdot k)}$$

Include phase space:

$$H_{q\bar{q}g}^{\mu\nu} d\Phi_{q\bar{q}g} \simeq H_{q\bar{q}}^{\mu\nu} d\Phi_{q\bar{q}} \underbrace{\frac{d^3 \vec{k}}{(2\pi)^3 2\omega} C_F g^2 \frac{2p_1 \cdot p_2}{(p_1 \cdot k)(p_2 \cdot k)}}_{\text{soft-gluon factor} \equiv dS}$$

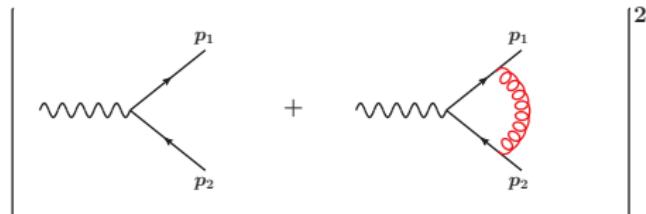

In the quark-antiquark c.o.m. frame

$$\begin{aligned} dS &= \omega d\omega d\cos\theta \frac{d\phi}{2\pi} \frac{2\alpha_s C_F}{\pi} \underbrace{\frac{2p_1 \cdot p_2}{(2p_1 \cdot k)(2p_2 \cdot k)}}_{\frac{1}{\omega^2(1-\cos\theta^2)}} \quad \bar{q} \xrightarrow[p_2]{} q \\ &= \frac{2\alpha_s C_F}{\pi} \frac{d\omega}{\omega} \frac{d\theta}{\sin\theta} \frac{d\phi}{2\pi} \end{aligned}$$

Divergence for  $\omega \rightarrow 0$ : **soft**

Divergence for  $\theta = 0, \pi$ : **collinear**

## Virtual corrections: no gluon emission

Interference term,  $\mathcal{O}(\alpha_s)$ , in the region of soft gluon momenta:

$$H_{q\bar{q},V}^{\mu\nu} \simeq - H_{q\bar{q}}^{\mu\nu} \frac{2\alpha_s C_F}{\pi} \frac{d\omega}{\omega} \frac{d\theta}{\sin\theta} \frac{d\phi}{2\pi}$$

## Total cross section

It must include both real and virtual gluon emission:  $H_{q\bar{q},\text{tot}}^{\mu\nu} = H_{q\bar{q}g}^{\mu\nu} + H_{q\bar{q},V}^{\mu\nu}$   
infrared-finite!

$$\text{Actual calculation: } \sigma_{\text{tot}} = \sigma_B \left[ 1 + \frac{3}{4} C_F \frac{\alpha_s}{\pi} + \mathcal{O}(\alpha_s^2) \right]$$

## Lessons

- Infrared divergences are related to **long-distance/time** physics: an internal line “goes on-shell”.

Propagator:  $\frac{p'_1}{2p_1 \cdot k} \sim \frac{1}{\omega\theta^2}$

Time scales: soft,  $\sim 1/(\omega\theta^2)$ , much larger than hard,  $\sim 1/Q$

- The cancellation of infrared divergences occurs for “inclusive enough” final states  
- **Kinoshita-Lee-Nauenberg theorem** [Kinoshita (1962); Lee, Nauenberg (1964)]

In our example, at the  $\mathcal{O}(\alpha_s)$  two **degenerate** final states were considered,  $q\bar{q}$  and  $q\bar{q}g$ , which are not experimentally distinguishable for a soft/collinear gluon.

- Infrared-safe observables** must be insensitive to emissions of soft/collinear partons:

$$O_{n+1}(p_1, \dots, \lambda p_n, (1 - \lambda)p_n) = O_n(p_1, \dots, p_n)$$

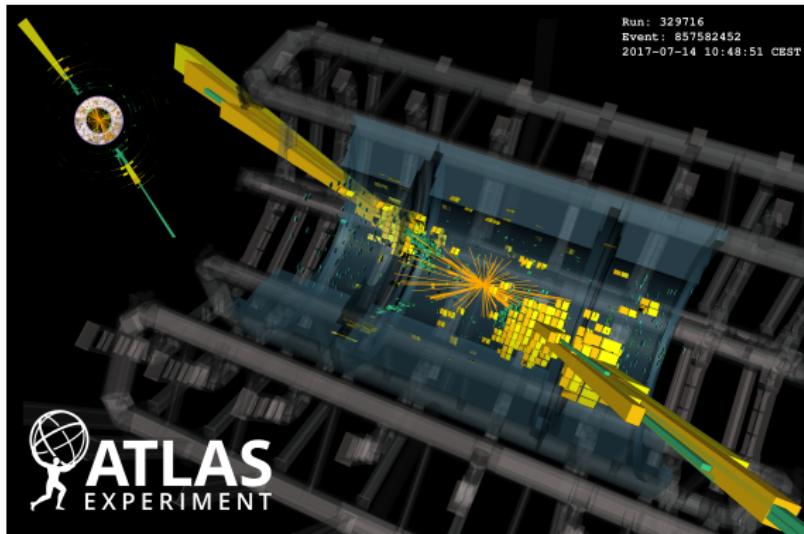

$$O_{n+1}(p_1, \dots, p_n, p_{n+1} \rightarrow 0) = O_n(p_1, \dots, p_n)$$

Relevant for *event shape observables* and *jet algorithms*.

# Jets

Hard QCD processes are perturbatively described in terms of scattered partons (quark and gluons) ...

... but detectors see just colorless hadrons, which, however, cluster into groups or **jets**, which can reveal the original hard scattering process.

Two-jet event,  $\sqrt{s} = 13$  TeV [ATLAS Experiment @ 2021 CERN]

# Jet reconstruction

- Distance between particles  $i$  and  $j$

$$(\Delta R_{ij})^2 = (y_i - y_j)^2 + (\phi_i - \phi_j)^2$$

$$\underbrace{y = \frac{1}{2} \ln \frac{E + p_z}{E - p_z}}_{\text{rapidity}} \stackrel{m=0}{=} \frac{1}{2} \ln \frac{1 + \cos \theta}{1 - \cos \theta} = \underbrace{-\ln \tan \frac{\theta}{2}}_{\text{pseudo-rapidity}} = \eta$$

- Recombination

$$k_T : \quad y_{ij} = \frac{\Delta R_{ij}}{R} \min(p_{T,i}, p_{T,j}) \quad y_{iB} = p_{T,i}$$

$$\text{Cambridge/Aachen :} \quad y_{ij} = \frac{\Delta R_{ij}}{R} \quad y_{iB} = 1$$

$$\text{anti-}k_T : \quad y_{ij} = \frac{\Delta R_{ij}}{R} \min(p_{T,i}^{-1}, p_{T,j}^{-1}) \quad y_{iB} = p_{T,i}^{-1}$$

1) Find  $\min_{ij}(y_{ij}, y_{iB}) \equiv y_{\min}$ .

2a) If  $y_{\min} = y_{ij} < y_{\text{cut}}$ , then  $i + j \rightarrow i$ ; go back to 1).

2b) If  $y_{\min} = y_{iB} < y_{\text{cut}}$ , remove subject  $i$  (beam radiation); go back to 1).

3) If  $y_{\min} > y_{\text{cut}}$  all subjects are jets.

$R$  and  $y_{\text{cut}}$  are parameters.

# Jet reconstruction

- **Momenta combination**

$$\vec{p}_i + \vec{p}_j \rightarrow \vec{p}_i$$

Two options for the 0-th component:

i) fix it so to make the new subject's invariant mass equal to zero  
(the ideal reconstruction should trace back to massless partons)

ii)  $p_i^0 + p_j^0 \rightarrow p_i^0$

(allows to extend jet algorithms to massive particles, such as  $Z$ ,  $W$ , ...)

The (anti-) $k_t$  algorithm starts building a jet with (hard) soft constituents;  
Cambridge/Aachen is purely geometrical.

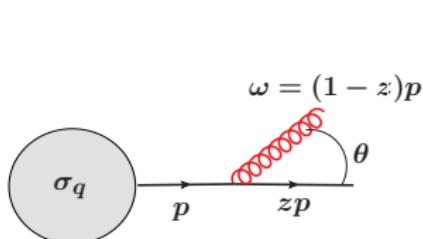

They are all **infrared safe**.

# Outline

- 1 Why QCD?
- 2 Building the theory

# QCD-improved parton model

- Infrared safety for final-state quark splitting

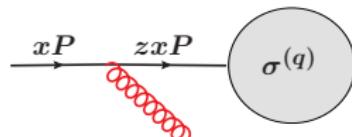

$$\begin{aligned} d\sigma_{q+g} &\simeq \sigma_q \frac{\alpha_s C_F}{\pi} \frac{d\omega}{\omega} \frac{d\theta^2}{\theta^2} \\ &\simeq \sigma_q \frac{\alpha_s C_F}{\pi} \frac{dz}{1-z} \frac{dk_t^2}{k_t^2}, \quad k_t \simeq \omega\theta \end{aligned}$$

Virtual corrections to  $\sigma_q$  (only soft part):

$$d\sigma_{q,V} \simeq -\sigma_q \frac{\alpha_s C_F}{\pi} \frac{dz}{1-z} \frac{dk_t^2}{k_t^2}$$

- Infrared safety for initial-state quark splitting

$$d\sigma_g^{(q)} \simeq \sigma^{(q)}(zxP) \frac{\alpha_s C_F}{\pi} \frac{dz}{1-z} \frac{dk_t^2}{k_t^2}$$

Virtual corrections to  $\sigma^{(q)}$  (only soft part):

$$d\sigma_V^{(q)} \simeq -\sigma^{(q)}(xP) \frac{\alpha_s C_F}{\pi} \frac{dz}{1-z} \frac{dk_t^2}{k_t^2}$$

Integrate over the kinematics of the emitted gluon:

$$\sigma_g^{(q)} + \sigma_V^{(q)} \simeq \frac{\alpha_s C_F}{\pi} \underbrace{\int \frac{dk_t^2}{k_t^2}}_{\text{infinite, collinear}} \underbrace{\int_0^1 \frac{dz}{1-z} [\sigma^{(q)}(zxP) - \sigma^{(q)}(xP)]}_{\text{finite, soft}}$$

- $$\frac{\alpha_s C_F}{\pi} \int_0^1 \frac{dz}{1-z} [\sigma^{(q)}(zxP) - \sigma^{(q)}(xP)] = \frac{\alpha_s}{2\pi} \int_0^1 dz \underbrace{P_{qq}(z)|_{\text{soft}}}_{C_F \left(\frac{2}{1-z}\right)_+} \sigma^{(q)}(zxP)$$

$$P_{qq} = C_F \left( \frac{1+z^2}{1-z} \right)_+, \quad \int_0^1 dz f(z)_+ g(z) \equiv \int_0^1 dz f(z) [g(z) - g(1)]$$
- $$\int \frac{dk_t^2}{k_t^2} \rightarrow \int_{\mu_h^2}^{Q^2} \frac{dk_t^2}{k_t^2} = \int_{\mu_F^2}^{\mu_F^2} \frac{dk_t^2}{k_t^2} + \int_{\mu_F^2}^{Q^2} \frac{dk_t^2}{k_t^2} = \ln \frac{\mu_F^2}{\mu_h^2} + \ln \frac{Q^2}{\mu_F^2}$$

So that

$$\sigma_g^{(q)} + \sigma_V^{(q)} \simeq \frac{\alpha_s}{2\pi} \left( \ln \frac{\mu_F^2}{\mu_h^2} + \ln \frac{Q^2}{\mu_F^2} \right) \int_0^1 dz P_{qq}(z)|_{\text{soft}} \sigma^{(q)}(zxP)$$

Get the hadronic cross section, including leading order:

$$\begin{aligned}\sigma^{(h)} &= \underbrace{\int_0^1 dx f_q(x) [\sigma^{(q)}(xP) + \sigma_g^{(q)} + \sigma_V^{(q)}]}_{\text{parton model}} \\ &= \int_0^1 dx f_q(x) \left[ \sigma^{(q)}(xP) + \frac{\alpha_s}{2\pi} \left( \ln \frac{\mu_F^2}{\mu_h^2} + \ln \frac{Q^2}{\mu_F^2} \right) \int_0^1 dz P_{qq}(z)|_{\text{soft}} \sigma^{(q)}(zxP) \right]\end{aligned}$$

Observe that

$$\begin{aligned}&\int_0^1 dx f_q(x) \left[ \sigma^{(q)}(xP) + \frac{\alpha_s}{2\pi} \ln \frac{\mu_F^2}{\mu_h^2} \int_0^1 dz P_{qq}(z)|_{\text{soft}} \sigma^{(q)}(zxP) \right] \\ &= \int_0^1 dx \left[ f_q(x) \sigma^{(q)}(xP) + \frac{\alpha_s}{2\pi} \ln \frac{\mu_F^2}{\mu_h^2} \int_x^1 \frac{dz}{z} f_q\left(\frac{x}{z}\right) P_{qq}(z)|_{\text{soft}} \sigma^{(q)}(xP) \right] \\ &= \int_0^1 dx \underbrace{\left[ f_q(x) + \frac{\alpha_s}{2\pi} \ln \frac{\mu_F^2}{\mu_h^2} \int_x^1 \frac{dz}{z} f_q\left(\frac{x}{z}\right) P_{qq}(z)|_{\text{soft}} \right]}_{f_q(x, \mu_F)} \sigma^{(q)}(xP)\end{aligned}$$

So, finally

$$\sigma^{(h)} = \int_0^1 dx f_q(x, \mu_F) \left[ \sigma^{(q)}(xP) + \frac{\alpha_s}{2\pi} \ln \frac{Q^2}{\mu_F^2} \int_0^1 dz P_{qq}(z)|_{\text{soft}} \sigma^{(q)}(zxP) \right] + \mathcal{O}(\alpha_s^2)$$

- Renormalized partonic distributions, such as  $f_q(x, \mu_F)$  are non-perturbative objects, but their dependence on  $\mu_F$  is perturbative:

$$\frac{\partial f_q(x, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \int_x^1 \frac{dz}{z} P_{qq}(z)|_{\text{soft}} f_q\left(\frac{x}{z}\right)$$

- The actual calculation, taking also into account all splitting options, gives:

$$\frac{\partial f_q(x, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \int_x^1 \frac{dz}{z} \left[ P_{qq}(z)f_q\left(\frac{x}{z}\right) + P_{qg}(z)f_g\left(\frac{x}{z}\right) \right]$$

$$\frac{\partial f_g(x, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \int_x^1 \frac{dz}{z} \left[ P_{gg}(z)f_g\left(\frac{x}{z}\right) + \sum_{a=q, \bar{q}} P_{ga}(z)f_a\left(\frac{x}{z}\right) \right]$$

$$P_{qq} = C_F \left( \frac{1+z^2}{1-z} \right)_+, \quad P_{gq} = C_F \left( \frac{1+(1-z)^2}{z} \right), \quad P_{qg} = T_R [z^2 + (1-z)^2],$$

$$P_{gg} = 2C_A \left( \frac{z}{(1-z)_+} + \frac{1-z}{z} + z(1-z) \right) + \frac{11C_A - 4n_f T_R}{6} \delta(1-z)$$

[Dokshitzer (1977); Gribov, Lipatov (1972); Altarelli, Parisi (1977)]

$P_{gg}$  and  $P_{gq}$  diverge for  $z \rightarrow 0$ : gluon dominance at small  $x$ .

## How to solve DGLAP equations?

Simplified DGLAP equation:

$$\frac{\partial f(x, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \int_x^1 \frac{dz}{z} P(z) f\left(\frac{x}{z}\right)$$

Move to moment space, through a Mellin transform:

$$f(n) = \int_0^1 dx x^{n-1} f(x), \quad f(x) = \int_{\delta-i\infty}^{\delta+i\infty} dn x^{-n} f(n)$$

with  $\delta$  to the right of all singularities in the analytic continuation of  $f(n)$ .

In moment space the DGLAP equation becomes

$$\frac{\partial f(n, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \gamma(n) f(n) \longrightarrow f(n, \mu_F) = f(n, \mu_0) \left( \frac{\mu^2}{\mu_0^2} \right)^{\frac{\alpha_s}{2\pi} \gamma(n)}$$

with  $\gamma(n) = P(n)$  (anomalous dimension).

Leading logs  $\alpha_s^n \log^n \mu_F^2$  resummed to all orders!

Example:  $f_u - f_d \equiv f_{\text{NS}}$

$$\frac{\partial f_{\text{NS}}(x, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \int_x^1 \frac{dz}{z} P_{qq}(z) f_{\text{NS}}\left(\frac{x}{z}\right)$$
$$f_{\text{NS}}(n, \mu_F) = f_{\text{NS}}(n, \mu_0) \left(\frac{\mu^2}{\mu_0^2}\right)^{\frac{\alpha_s}{2\pi} \gamma_{qq}(n)}$$

Flavor number conservation (e.g. in the proton)

$$\int_0^1 dx (f_u(x) - f_d(x)) = 2 , \quad \rightarrow \quad f_{\text{NS}}(n=1) = 2 \quad \rightarrow \quad \gamma_{qq}(n=1) = 0$$

which holds true since

$$\gamma_{qq}(1) = \int_0^1 dx P_{qq}(x) = C_F \int_0^1 dx \left(\frac{1+x^2}{1-x}\right)_+ = 0$$

# DGLAP at higher orders

$$\frac{\partial f_i(x, \mu_F)}{\partial \ln \mu_F^2} = \frac{\alpha_s(\mu_F)}{2\pi} \sum_j P_{ij} \otimes f_j(\mu_F)$$

$$P_{ij} = P_{ij}^{(0)} + \frac{\alpha_s}{2\pi} P_{ij}^{(1)} + \left(\frac{\alpha_s}{2\pi}\right)^2 P_{ij}^{(2)} + \dots$$

- LO  $P_{ij}^{(0)}$  [Dokshitzer (1977); Gribov, Lipatov (1972); Altarelli, Parisi (1977)]

resum all leading logs,  $\alpha_s^n \log^n \mu_F^2$

- NLO  $P_{ij}^{(1)}$  [Curci, Furmanski, Petronzio (1980)]

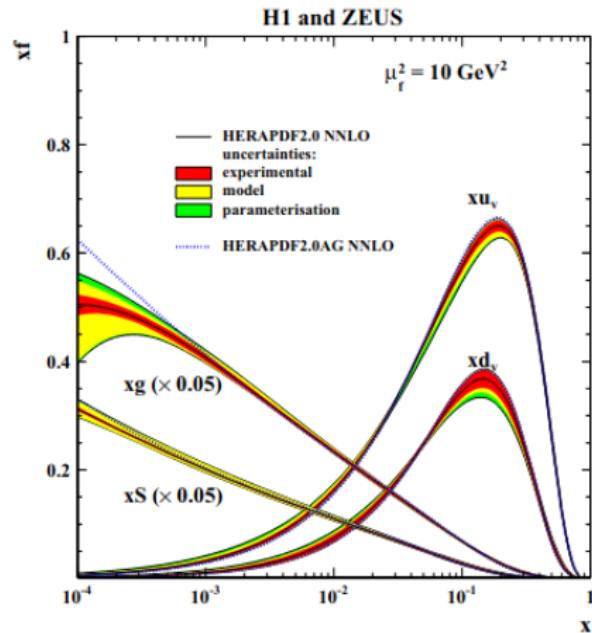

resum all next-to-leading logs,  $\alpha_s^{n+1} \log^n \mu_F^2$

- NNLO  $P_{ij}^{(2)}$  [Moch, Vermaseren, Vogt (2004)]

resum all next-to-next-to-leading logs,  $\alpha_s^{n+2} \log^n \mu_F^2$

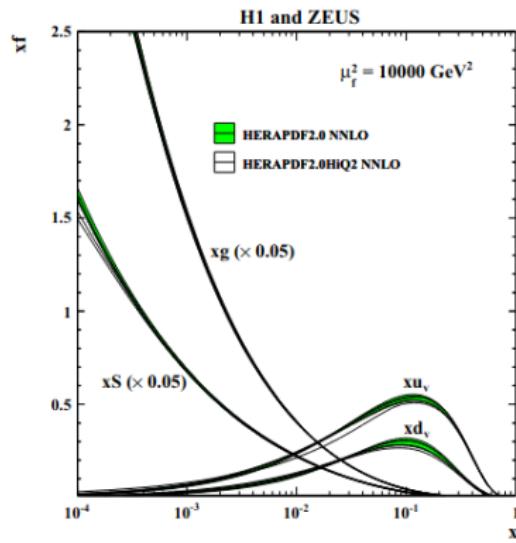

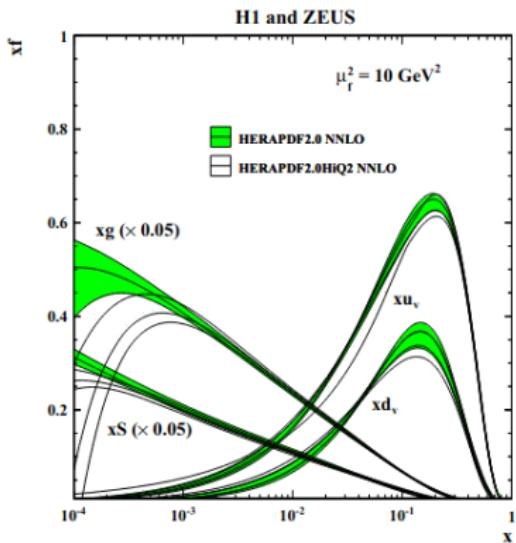

# Proton PDFs

Partonic distribution functions (PDFs) are extracted from experiments, using an **input parametrization** at some (low) scale  $\mu_0$  and **DGLAP-evolving** it to higher scales.

$$\begin{aligned}xU &= xf_u + xf_c \\x\bar{U} &= xf_{\bar{u}} + xf_{\bar{c}} \\xD &= xf_d + xf_s \\x\bar{D} &= xf_{\bar{d}} + xf_{\bar{s}} \\xu_v &= xU - x\bar{U} \\xd_v &= xD - x\bar{D} \\xS &= 2x(\bar{U} + \bar{D})\end{aligned}$$

[H. Abramowicz *et al.*, Eur. Phys. J. C (2015) 75:580, [arXiv:1506.06042]]

[H. Abramowicz *et al.*, Eur. Phys. J. C (2015) 75:580, [arXiv:1506.06042]]

# Factorization

Ingredients: inclusiveness, large  $s$ , hard scale  $Q \sim \sqrt{s}$

- lepton-hadron ( $H$ ) scattering (DIS):

$$\sigma(p, Q^2) = \sum_{a=q,\bar{q},g} \int_0^1 dz \underbrace{f_{a/H}(z, \mu_F)}_{\text{process independent}} \underbrace{\hat{\sigma}_a(zp, \alpha_s(Q^2), \mu_F)}_{\text{hard partonic cross section}}$$

- hadron ( $H_1$ )-hadron ( $H_2$ ) scattering:

$$\begin{aligned} \sigma(p_1, p_2, Q^2) &= \sum_{a,b} \int_0^1 dz_1 \int_0^1 dz_2 f_{a/H_1}(z_1, \mu_F) f_{b/H_2}(z_2, \mu_F) \\ &\quad \times \hat{\sigma}_{a,b}(z_1 p_1, z_2 p_2, \alpha_s(Q^2), \mu_F) \end{aligned}$$

E.g., Drell-Yan ( $H_1 + H_2 \rightarrow \mu^+ + \mu^- + X$  ,  $e^+ + e^- + X$  ,  $W + X$  ,  $Z + X$ )

$H_1 + H_2 \rightarrow$  jet +  $X$

$H_1 + H_2 \rightarrow$  heavy quark +  $X$

Corrections to factorization are power-suppressed,  $\mathcal{O}\left(\frac{m_h}{Q}\right)^n$ .

[Collins, Soper, Sterman (1981-1986)]

# Outline

## 1 Why QCD?

## 5 Using the theory (non-perturbatively)

- General setup
- Some selected results

## 6 Conclusions

# Semihard processes

Collision processes with the following **scale hierarchy**:

$$s \gg Q^2 \gg \Lambda_{\text{QCD}}^2$$

$Q$  is the **hard scale** of the process (e.g. photon virtuality, heavy quark mass, jet/hadron transverse momentum,  $t$ , etc.)

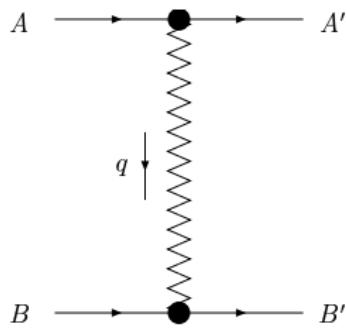

- large  $Q \implies \alpha_s(Q) \ll 1 \implies$  perturbative QCD
- large  $s \implies$  large energy logs  $\implies \alpha_s(Q) \log s \sim 1 \implies$  resummation

The **Balitsky-Fadin-Kuraev-Lipatov (BFKL)** approach provides with the general framework for this resummation.

# Gluon Reggeization in perturbative QCD

Elastic scattering process  $A + B \rightarrow A' + B'$

- gluon quantum numbers in the  $t$ -channel: octet color representation, negative signature
- Regge limit:  $s \simeq -u \rightarrow \infty$ ,  $t$  fixed (i.e. not growing with  $s$ )
- all-order resummation:  
leading logarithmic approximation (LLA):  $\alpha_s^n (\ln s)^n$   
next-to-leading logarithmic approximation (NLA):  $\alpha_s^{n+1} (\ln s)^n$

$$\left(\mathcal{A}_8^-\right)_{AB}^{A'B'} = \Gamma_{A'A}^c \left[ \left(\frac{-s}{-t}\right)^{j(t)} - \left(\frac{s}{-t}\right)^{j(t)} \right] \Gamma_{B'B}^c$$

$$j(t) = 1 + \omega(t), \quad j(0) = 1$$

$\omega(t)$  – Reggeized gluon trajectory

$$\Gamma_{A'A}^c = g \langle A' | T^c | A \rangle \Gamma_{A'A}$$

$T^c$  fundamental (quarks) or adjoint (gluons)

# Gluon Reggeization in perturbative QCD

Interlude: Sudakov decomposition

$$p = \beta p_1 + \alpha p_2 + p_\perp , \quad p_\perp^2 = -\vec{p}^2$$

$(p_1, p_2)$  light-cone basis of the initial particle momenta plane

$$p_A = p_1 + \frac{m_A^2}{s} p_2 , \quad p_B = p_2 + \frac{m_B^2}{s} p_1 , \quad 2 p_1 \cdot p_2 = s \quad \blacksquare$$

The gluon Reggeization has been first verified in fixed order calculations, then rigorously proved

- in the LLA

[Ya.Ya. Balitsky, V.S. Fadin, L.N. Lipatov (1979)]

$$\Gamma_{A'A}^{(0)} = \delta_{\lambda_{A'} \lambda_A} , \quad \omega^{(1)}(t) = \frac{g^2 t}{(2\pi)^{D-1}} \frac{N}{2} \int \frac{d^{D-2} k_\perp}{k_\perp^2 (q - k)_\perp^2} = -g^2 \frac{N \Gamma(1-\epsilon)}{(4\pi)^{D/2}} \frac{\Gamma^2(\epsilon)}{\Gamma(2\epsilon)} (\vec{q}^2)^\epsilon$$

$$D = 4 + 2\epsilon , \quad t = q^2 \simeq q_\perp^2$$

- in the NLA

[V.S. Fadin, R. Fiore, M.G. Kozlov, A.V. Reznichenko (2006)]

$$\Gamma_{A'A}^{(1)} = \delta_{\lambda_{A'} \lambda_A} \Gamma_{AA}^{(+)} + \delta_{\lambda_{A'}, -\lambda_A} \Gamma_{AA}^{(-)} , \quad \omega^{(2)}(t)$$

# Outline

## 6 Conclusions

# BFKL in leading accuracy

Inelastic scattering process  $A + B \rightarrow \tilde{A} + \tilde{B} + n$  in the LLA

$$\gamma_{c_i c_{i+1}}^{G_i}(q_i, q_{i+1}) \longrightarrow$$

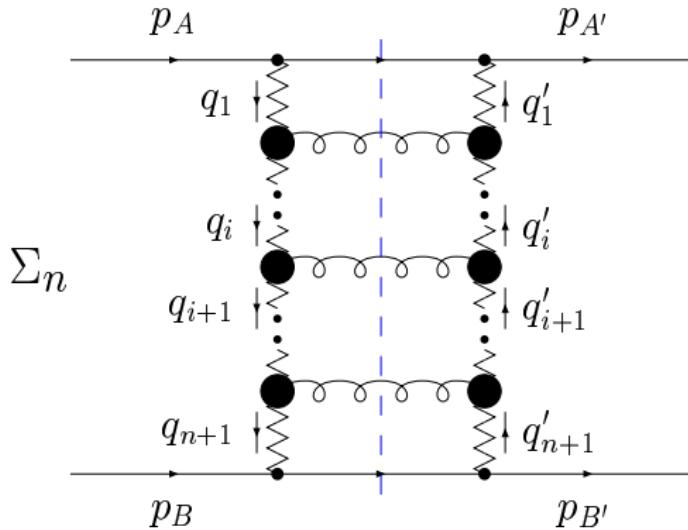

$$\text{Re } \mathcal{A}_{AB}^{\tilde{A}\tilde{B}+n} = 2s \Gamma_{\tilde{A}A}^{c_1} \left( \prod_{i=1}^n \gamma_{c_i c_{i+1}}^{P_i}(q_i, q_{i+1}) \left( \frac{s_i}{s_R} \right)^{\omega(t_i)} \frac{1}{t_i} \right) \frac{1}{t_{n+1}} \left( \frac{s_{n+1}}{s_R} \right)^{\omega(t_{n+1})} \Gamma_{\tilde{B}B}^{c_{n+1}}$$

$s_i$  invariant mass of the  $\{g_{i-1}, g_i\}$  system, proportional to  $s$

$s_R$  energy scale, irrelevant in the LLA

# BFKL in leading accuracy

Elastic amplitude  $A + B \rightarrow A' + B'$  in the LLA via  $s$ -channel unitarity

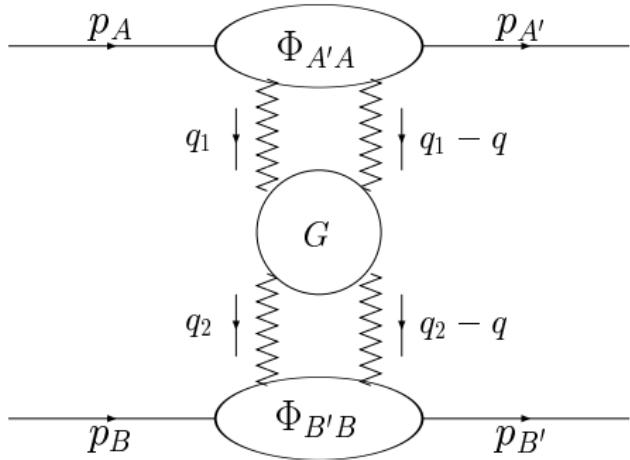

$$\mathcal{A}_{AB}^{A'B'} = \sum_{\mathcal{R}} (\mathcal{A}_{\mathcal{R}})_{AB}^{A'B'} , \quad \mathcal{R} = 1 \text{ (singlet)}, 8^- \text{ (octet)}, \dots$$

The  $8^-$  color representation is important for the **bootstrap**, i.e. the consistency between the above amplitude and that with one Reggeized gluon exchange

# BFKL in leading accuracy

Structure of the amplitude:

$$\begin{aligned} \text{Im}_s(A_{\mathcal{R}})_{AB}^{A'B'} &= \frac{s}{(2\pi)^{D-2}} \int \frac{d^{D-2}q_1}{\vec{q}_1^2(\vec{q}_1 - \vec{q})^2} \int \frac{d^{D-2}q_2}{\vec{q}_2^2(\vec{q}_2 - \vec{q})^2} \sum_{\nu} \Phi_{A'A}^{(\mathcal{R}, \nu)}(\vec{q}_1; \vec{q}) \\ &\times \int_{\delta-i\infty}^{\delta+i\infty} \frac{d\omega}{2\pi i} \left[ \left( \frac{s}{s_0} \right)^\omega G_{\omega}^{(\mathcal{R})}(\vec{q}_1, \vec{q}_2, \vec{q}) \right] \Phi_{B'B}^{(\mathcal{R}, \nu)}(-\vec{q}_2; -\vec{q}) \end{aligned}$$

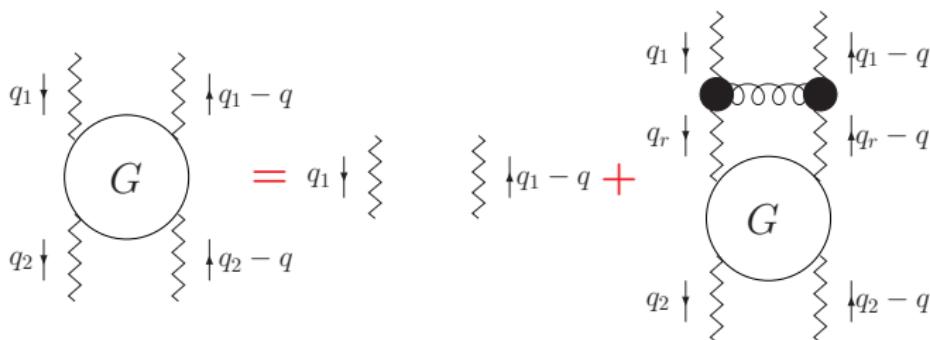

# BFKL in leading accuracy

- $G_\omega^{(\mathcal{R})}$  – Mellin transform of the Green's functions for Reggeon-Reggeon scattering

$$\begin{aligned}\omega G_\omega^{(\mathcal{R})} (\vec{q}_1, \vec{q}_2, \vec{q}) &= \vec{q}_1^2 (\vec{q}_1 - \vec{q})^2 \delta^{(D-2)} (\vec{q}_1 - \vec{q}_2) \\ &+ \int \frac{d^{D-2} q_r}{\vec{q}_r^2 (\vec{q}_r - \vec{q})^2} \mathcal{K}^{(\mathcal{R})} (\vec{q}_1, \vec{q}_r; \vec{q}) G_\omega^{(\mathcal{R})} (\vec{q}_r, \vec{q}_2; \vec{q})\end{aligned}$$

**BFKL equation:**  $t = 0$  and singlet color representation

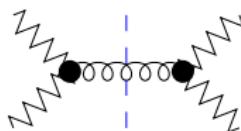

[Ya.Ya. Balitsky, V.S. Fadin, E.A. Kuraev, L.N. Lipatov (1975)]

# BFKL in leading accuracy

$$\mathcal{K}^{(\mathcal{R})}(\vec{q}_1, \vec{q}_2; \vec{q}) = \left[ \omega \left( -\vec{q}_1^2 \right) + \omega \left( -(\vec{q}_1 - \vec{q})^2 \right) \right] \delta^{(D-2)}(\vec{q}_1 - \vec{q}_2) + \mathcal{K}_r^{(\mathcal{R})}(\vec{q}_1, \vec{q}_2; \vec{q})$$

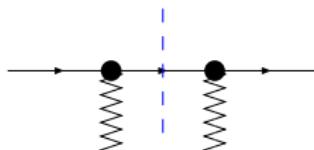

In the LLA:  $\omega(t) = \omega^{(1)}(t)$ ,  $\mathcal{K}_r = \mathcal{K}_{RRG}^{(B)}$

- $\Phi_{A'A}^{(\mathcal{R}, \nu)}$  – impact factors in the  $t$ -channel color state  $(\mathcal{R}, \nu)$

$$\Phi_{A'A} = \sum_{\{f\}} \int \frac{d\kappa}{2\pi} d\rho_f \Gamma_{\{f\}A}^c (\Gamma_{\{f\}A'}^{c'})^*$$

constant in the LLA

# BFKL in leading accuracy

Pomeron channel:  $t = 0$  and singlet color representation in the  $t$ -channel

Redefinition:  $G_\omega(\vec{q}_1, \vec{q}_2) \equiv \frac{G_\omega^{(0)}(\vec{q}_1, \vec{q}_2, 0)}{\vec{q}_1^2 \vec{q}_2^2}, \quad \mathcal{K}(\vec{q}_1, \vec{q}_2) \equiv \frac{\mathcal{K}^{(0)}(\vec{q}_1, \vec{q}_2, 0)}{\vec{q}_1^2 \vec{q}_2^2}$

$$\omega G_\omega(\vec{q}_1, \vec{q}_2) = \delta^{(D-2)}(\vec{q}_1 - \vec{q}_2) + \int d^{D-2}q_r \mathcal{K}(\vec{q}_1, \vec{q}_r) G_\omega(\vec{q}_r, \vec{q}_2)$$

$$\mathcal{K}(\vec{q}_1, \vec{q}_2) = 2\omega(-\vec{q}_1^2)\delta^{(D-2)}(\vec{q}_1 - \vec{q}_2) + \mathcal{K}_r(\vec{q}_1, \vec{q}_2)$$

Infrared divergences cancel in the singlet kernel

$\mathcal{K}(\vec{q}_1, \vec{q}_2)$  is scale-invariant  $\rightarrow$  its eigenfunctions are powers of  $\vec{q}_2^2$ :

$$\int d^{D-2}q_2 \mathcal{K}(\vec{q}_1, \vec{q}_2) (\vec{q}_2^2)^{\gamma-1} = \frac{N\alpha_s}{\pi} \chi(\gamma) (\vec{q}_1^2)^{\gamma-1}$$

$$\chi(\gamma) = 2\psi(1) - \psi(\gamma) - \psi(1-\gamma), \quad \psi(\gamma) = \frac{\Gamma'(\gamma)}{\Gamma(\gamma)}$$

The set of functions  $(\vec{q}_2^2)^{\gamma-1}$ , with  $\gamma = 1/2 + i\nu$ ,  $\nu \in (-\infty, +\infty)$  is complete.

# BFKL in leading accuracy

Total cross section for the process  $A + B \rightarrow \text{all}$

$$\begin{aligned}\sigma_{AB}(s) &= \frac{\text{Im}_s(\mathcal{A}_{AB}^{AB})}{s} \\ &= \frac{1}{(2\pi)^{D-2}} \int \frac{d^{D-2}\vec{q}_A}{\vec{q}_A^2} \Phi_A(\vec{q}_A) \int \frac{d^{D-2}\vec{q}_B}{\vec{q}_B^2} \Phi_B(-\vec{q}_B) \int_{\delta-i\infty}^{\delta+i\infty} \frac{d\omega}{2\pi i} \left(\frac{s}{s_0}\right)^\omega G_\omega(\vec{q}_A, \vec{q}_B)\end{aligned}$$

Using the complete set of kernel eigenfunctions, the BFKL equation and  $D = 4$

$$\begin{aligned}\sigma_{AB}(s) &= \int_{\delta-i\infty}^{\delta+i\infty} \frac{d\omega}{2\pi i} \int_{-\infty}^{+\infty} \frac{d\nu}{2\pi^2(\omega - \frac{N\alpha_s}{\pi}\chi(1/2 + i\nu))} \\ &\times \int \frac{d^2\vec{q}_A}{2\pi} \int \frac{d^2\vec{q}_B}{2\pi} \left(\frac{s}{s_0}\right)^\omega \Phi_A(\vec{q}_A)(\vec{q}_A^2)^{-i\nu-3/2} \Phi_B(-\vec{q}_B)(\vec{q}_B^2)^{i\nu-3/2}\end{aligned}$$

Infrared finiteness guaranteed for colorless colliding particles

[V.S. Fadin, A.D. Martin (1999)]

# BFKL in leading accuracy

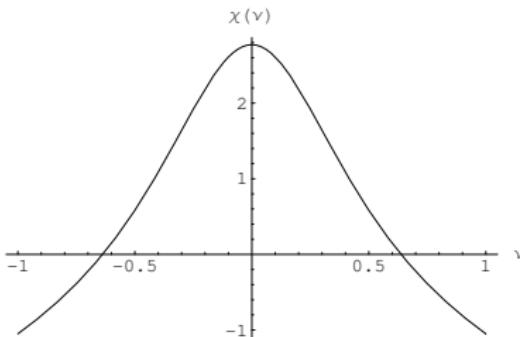

Contour integration over  $\omega$

$$\sigma_{AB}(s) = \int_{-\infty}^{+\infty} \frac{d\nu}{2\pi^2} \int \frac{d^2\vec{q}_A}{2\pi} \int \frac{d^2\vec{q}_B}{2\pi} \left( \frac{s}{s_0} \right)^{\bar{\alpha}_s \chi(\nu)} \Phi_A(\vec{q}_A)(\vec{q}_A^2)^{-i\nu-3/2} \Phi_B(-\vec{q}_B)(\vec{q}_B^2)^{i\nu-3/2}$$
$$\bar{\alpha}_s \equiv \frac{N\alpha_s}{\pi}, \quad \chi(\nu) \equiv \chi(1/2 + i\nu)$$

Saddle point approximation:  
 $\chi(\nu) = 4 \ln 2 - 14\zeta(3)\nu^2 + O(\nu^4)$

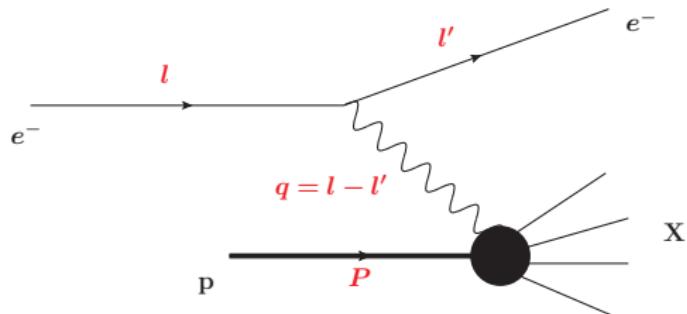

$$\sigma_{AB}(s) \sim \frac{s^{4\bar{\alpha}_s \ln 2}}{\sqrt{\ln s}}$$

$$\omega_P = 4\bar{\alpha}_s \ln 2 \simeq 0.40 \text{ for } \alpha_s = 0.15$$

- unitarity is violated; BFKL cannot be applied at asymptotically high energies
- the scale of  $s$  and the argument of the running coupling constant are not fixed in the LLA → NLA

# BFKL and deep inelastic scattering

$$q^2 = (l - l')^2 \equiv -Q^2$$

$$s = (l + P)^2$$

$$W^2 = (P + q)^2$$

$$x_B = \frac{Q^2}{2P \cdot q} \simeq \frac{Q^2}{Q^2 + W^2}, \quad W^2 \simeq \frac{Q^2(1 - x_B)}{x_B}$$

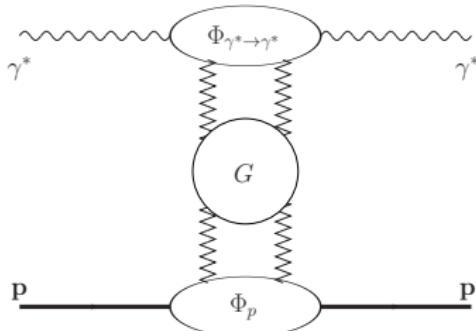

$$y = \frac{q \cdot P}{l \cdot P} \simeq \frac{Q^2}{x_B s}$$

$$\frac{d^2\sigma}{dx_B dQ^2} = \frac{2\pi\alpha_{\text{em}}^2}{x_B Q^4} \left\{ [1 + (1 - y)^2] F_2(x_B, Q^2) - y^2 F_L(x_B, Q^2) \right\}$$

$$F_2(x_B, Q^2) = \frac{Q^2}{4\pi^2\alpha_{\text{em}}} [\sigma_T(x_B, Q^2) + \sigma_L(x_B, Q^2)]$$

$$F_L(x_B, Q^2) = \frac{Q^2}{4\pi^2\alpha_{\text{em}}} \sigma_L(x_B, Q^2)$$

**Low- $x_B$  (or large  $W^2$ ) regime:**  $W^2 \gg Q^2 \gg M_P^2 \quad \rightarrow \quad x_B \ll 1$

$$\begin{aligned} F_2(x_B, Q^2) &\sim \sigma_{\text{tot}}(\gamma^* p) \\ &= \frac{\mathcal{I}m\mathcal{A}(\gamma^* p \rightarrow \gamma^* p)|_{t=0}}{W^2} \\ &\sim x_B^{-4\bar{\alpha}_S \ln 2} \end{aligned}$$

$$\sigma_{T,L} = \Phi_{T,L} \otimes \underbrace{G \otimes \Phi_p}_{\text{UGD}}$$

Straightforward emergence of the “unintegrated gluon distribution (UGD)”:

- valid both in the LLA and in the NLA
- not unambiguous: normalization,  $s_0$ -scale setting, etc., follow from the definition of the (photon) impact factor
- non-perturbative ...
  - the proton impact factor  $\Phi_p$  is intrinsically non-perturbative
  - unavoidable diffusion in the infrared of the transverse momentum integration
- ... but  $(\ln x)$ -resummation automatically encoded.

## Let's get a closer look (only in the LLA)...

$$\begin{aligned}\sigma_{T,L}(x, Q^2) &= \frac{1}{(2\pi)^2} \int \frac{d^2 \vec{k}}{\vec{k}^2} \int \frac{d^2 \vec{k}'}{\vec{k}'^2} \Phi_{T,L}(Q^2, \vec{k}) G(x, \vec{k}, \vec{k}') \Phi_p(-\vec{k}') \\ &= 2\pi \int \frac{d^2 \vec{k}}{(\vec{k}^2)^2} \underbrace{\Phi_{T,L}(Q^2, \vec{k})}_{\text{known at LO}} \underbrace{\frac{\vec{k}^2}{(2\pi)^3} \int \frac{d^2 \vec{k}'}{\vec{k}'^2} G(x, \vec{k}, \vec{k}') \Phi_p(-\vec{k}')}_{\mathcal{F}(x, \vec{k})}\end{aligned}$$

In the limit  $Q^2 \rightarrow \infty$  (**double leading-log approximation**):

$$\frac{\partial F_2(x, Q^2)}{\partial \ln Q^2} = \sum_{q=1}^{n_f} e_q^2 \frac{\bar{\alpha}_s}{9} G(x, Q^2), \quad G(x, Q^2) \equiv \int \frac{d^2 \vec{k}}{\pi \vec{k}^2} \Theta(Q^2 - \vec{k}^2) \mathcal{F}(x, \vec{k})$$

Using a specific model for the proton impact factor,  $\Phi_p(\vec{k}) \sim \left(\frac{\vec{k}^2}{\vec{k}^2 + \mu^2}\right)^\delta$ ,

$$\frac{\mathcal{F}(x, \vec{k})}{\vec{k}^2} \propto \frac{1}{2\pi} \int_{-\infty}^{+\infty} \frac{d\nu}{\sqrt{\mu^2 \vec{k}^2}} \left(\frac{\vec{k}^2}{\mu^2}\right)^{i\nu} e^{\bar{\alpha}_s \chi(\nu) \ln 1/x} \frac{\Gamma(\delta - 1/2 - i\nu) \Gamma(1/2 + i\nu)}{\Gamma(\delta)}$$

$$F_2(x, Q^2) \approx \mathcal{N}(\delta) \bar{\alpha}_s \sum e_q^2 \left(\frac{Q^2}{\mu^2}\right)^{1/2} e^{\omega_P \ln 1/x} \exp\left(-\frac{\ln^2(Q^2/\mu^2)}{56\bar{\alpha}_s \zeta(3) \ln 1/x}\right)$$

by the saddle point method at  $\nu = 0$  (recall,  $\omega_P = 4\bar{\alpha}_s \ln 2$ )

Mellin transforms

$$\mathcal{F}_N(\vec{k}) = \int_0^1 dx x^{N-1} \mathcal{F}(x, \vec{k}), \quad N \text{ stands for } \omega$$

$$\tilde{\mathcal{F}}_N(\gamma) = \int_1^\infty d \left( \frac{\vec{k}^2}{\mu^2} \right) \left( \frac{\vec{k}^2}{\mu^2} \right)^{-\gamma-1} \mathcal{F}_N(\vec{k})$$

Apply to

$$F_2(x, Q^2) = \frac{Q^2}{4\pi^2 \alpha} [\sigma_T(x, Q^2) + \sigma_L(x, Q^2)]$$

$$\sigma_{T,L}(x, Q^2) = 2\pi \int \frac{d^2 \vec{k}}{(\vec{k}^2)^2} \Phi_{T,L}(Q^2, \vec{k}) \mathcal{F}(x, \vec{k})$$

$$\longrightarrow F_{2,N}(Q^2) = \int_{1/2-i\infty}^{1/2+i\infty} \frac{d\gamma}{2\pi i} \frac{h_{2,N}(\gamma)}{\gamma^2} \underbrace{\frac{1}{(2\pi)^3} \frac{\Phi_p(\gamma, \mu)}{N}}_{\tilde{\mathcal{F}}_N^0(\gamma)} \frac{N}{N - \bar{\alpha}_s \chi(\gamma)} \left( \frac{Q^2}{\mu^2} \right)^\gamma$$

with  $\gamma = 1/2 + i\nu$  and  $\chi(\gamma)$  stands for the previous  $\chi(\nu)$

Contour integral in the  $\gamma$ -plane (left half plane):

- (a) simple (!) pole at  $\gamma = 0$  (contributes with  $Q^2$ -independent term)
- (b) pole at  $\bar{\gamma}$  such that  $N = \bar{\alpha}_s \chi(\bar{\gamma})$
- (c) other poles (from  $h_{2,N}$ ) contribute with terms suppressed in  $Q^2$

Up to a  $Q^2$ -independent additive term,

$$\frac{\partial F_{2,N}(Q^2)}{\partial \ln Q^2} = h_{2,N}(\bar{\gamma}) R_N \tilde{F}_N^0(\bar{\gamma}) \left( \frac{Q^2}{\mu^2} \right)^{\bar{\gamma}}, \quad R_N = \frac{1}{-\bar{\alpha}_s \bar{\gamma} \chi'(\bar{\gamma})/N}$$

i) Expanding  $\chi(\bar{\gamma})$  around  $\bar{\gamma} = 1/2$  (i.e.  $\nu = 0$ ) and solving  $N = \bar{\alpha}_s \chi(\bar{\gamma})$ , one gets

$$\bar{\gamma} \simeq \frac{1}{2} - \sqrt{\frac{N - \omega_P}{14\bar{\alpha}_s \zeta(3)}}, \quad R_N \simeq -\frac{\omega_P}{\sqrt{14\bar{\alpha}_s \zeta(3)(N - \omega_P)}}$$

and the Mellin anti-transform gives back

$$F_2(x, Q^2) \approx \mathcal{N}(\delta) \bar{\alpha}_s \sum_q e_q^2 \left( \frac{Q^2}{\mu^2} \right)^{1/2} e^{\omega_P \ln 1/x} \exp \left( -\frac{\ln^2(Q^2/\mu^2)}{56\bar{\alpha}_s \zeta(3) \ln 1/x} \right)$$

ii) **Scaling violations** even at asymptotically large  $Q^2$ :

$$N = \bar{\alpha}_s \chi(\bar{\gamma}), \quad \chi(\gamma) = \frac{1}{\gamma} + 2 \sum_{r=1}^{\infty} \zeta(2r+1) \gamma^{2r}, \quad |\gamma| < 1$$

$$\rightarrow \bar{\gamma} = \frac{\bar{\alpha}_s}{N} + 2\zeta(3) \left( \frac{\bar{\alpha}_s}{N} \right)^4 + 2\zeta(5) \left( \frac{\bar{\alpha}_s}{N} \right)^6 + \mathcal{O} \left( \frac{\bar{\alpha}_s}{N} \right)^7$$

### BFKL anomalous dimension

## Contact with the DGLAP formalism

$$G(x, Q^2) \equiv xg(x, Q^2), \quad \Sigma(x, Q^2) \equiv \sum_{i=1}^{n_f} [xq_i(x, Q^2) + x\bar{q}_i(x, Q^2)]$$

$$\frac{\partial}{\partial \ln Q^2} \begin{pmatrix} \Sigma_N(Q^2) \\ G_N(Q^2) \end{pmatrix} = \begin{pmatrix} \gamma_{qq}^N & 2n_f \gamma_{qg}^N \\ \gamma_{gg}^N & \gamma_{gg}^N \end{pmatrix} \begin{pmatrix} \Sigma_N(Q^2) \\ G_N(Q^2) \end{pmatrix}$$

$$F_{2,N}(Q^2) = \sum_i e_i^2 C_{i,N}(Q^2/\mu_F^2, \alpha_s(\mu_F^2)) Q_{i,N}(\mu_F^2) + C_{g,N}(Q^2/\mu_F^2, \alpha_s(\mu_F^2)) G_N(\mu_F^2)$$

(i) Leading order, (ii)  $\mu_F = Q$ , (iii) neglect quark densities at low  $x$ , (iv) neglect derivatives wrt  $\ln Q^2$  of coefficient functions (subleading):

$$\frac{\partial F_{2,N}(Q^2)}{\partial \ln Q^2} = (\langle e_q^2 \rangle 2n_f \gamma_{qg}^N + C_g^N(1, \alpha_s) \gamma_{gg}^N) G_N(Q^2)$$

$$G_N(Q^2) = G_N(\mu^2) \left( \frac{Q^2}{\mu^2} \right)^{\gamma_{gg}^N}$$

Compare with

$$\begin{aligned} \frac{\partial F_{2,N}(Q^2)}{\partial \ln Q^2} &= h_{2,N}(\bar{\gamma}) R_N \tilde{\mathcal{F}}_N^0(\bar{\gamma}) \left( \frac{Q^2}{\mu^2} \right)^{\bar{\gamma}} \\ &\longrightarrow \gamma_{gg}^N = \bar{\gamma} = \frac{\bar{\alpha}_s}{N} \end{aligned}$$

Note also that  $\gamma_{qg}^N|_{N \rightarrow 0} = \frac{\bar{\alpha}_s}{18}$  and  $h_{2,N}(\bar{\gamma}) = \bar{\alpha}_s \langle e_q^2 \rangle \frac{n_f}{9}$ .

BFKL predicts the most singular part of  $\gamma_{gg}^N$  to all orders in  $\alpha_s$ .

# BFKL in next-to-leading accuracy

Production amplitudes keep the simple factorized form

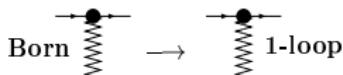

$$\text{Re} A_{AB}^{\tilde{A}\tilde{B}+n} = 2s \Gamma_{\tilde{A}A}^{c_1} \left( \prod_{i=1}^n \gamma_{c_i c_{i+1}}^{P_i}(q_i, q_{i+1}) \left( \frac{s_i}{s_R} \right)^{\omega(t_i)} \frac{1}{t_i} \right) \frac{1}{t_{n+1}} \left( \frac{s_{n+1}}{s_R} \right)^{\omega(t_{n+1})} \Gamma_{\tilde{B}B}^{c_{n+1}}$$

but, with respect to the LLA case, one replacement is allowed among the following:

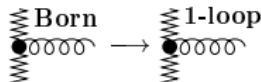

multi-Regge kinematics

- $\omega^{(1)} \rightarrow \omega^{(2)}$

- $\Gamma_{P'P}^c(\text{Born}) \rightarrow \Gamma_{P'P}^c(\text{1-loop})$

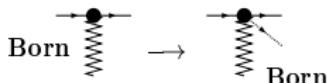

- $\gamma_{c_i c_{i+1}}^{G_i}(\text{Born}) \rightarrow \gamma_{c_i c_{i+1}}^{G_i}(\text{1-loop})$

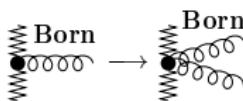

# BFKL in next-to-leading accuracy

quasi-multi-Regge kinematics

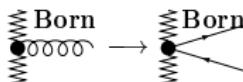

- $\Gamma_{P'P}^c(\text{Born}) \longrightarrow \Gamma_{\{f\}P}^c(\text{Born})$

- $\gamma_{c_i c_{i+1}}^{G_i(\text{Born})} \longrightarrow \gamma_{c_i c_{i+1}}^{Q\bar{Q}(\text{Born})}$

- $\gamma_{c_i c_{i+1}}^{G_i(\text{Born})} \longrightarrow \gamma_{c_i c_{i+1}}^{GG(\text{Born})}$

# Mueller-Navelet jets

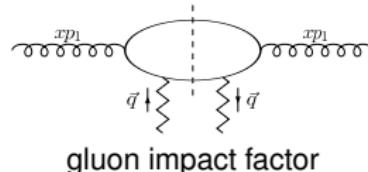

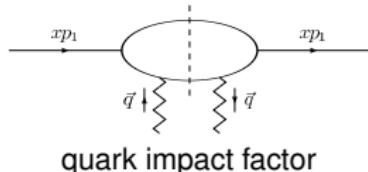

- large jet transverse momenta (hard scales):  $\vec{k}_1^2 \sim \vec{k}_2^2 \gg \Lambda_{\text{QCD}}^2$
- large rapidity gap between jets,  $\Delta y \equiv Y = y_{J_1} - y_{J_2}$ , which requires large c.m. energy of the proton collisions,  $s = 2p_1 \cdot p_2 \gg \vec{k}_{1,2}^2$

[A.H. Mueller, H. Navelet (1987)]

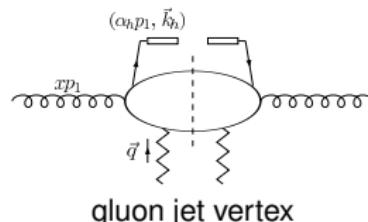

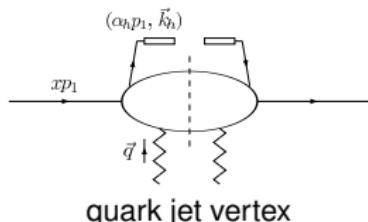

- Step 0: take the impact factors for colliding partons

[V.S. Fadin, R. Fiore, M.I. Kotsky, A.P. (2000)]

[M. Ciafaloni and G. Rodrigo (2000)]

- Step 1: "open" one of the integrations over the phase space of the intermediate state to "allow" one parton to generate the jet

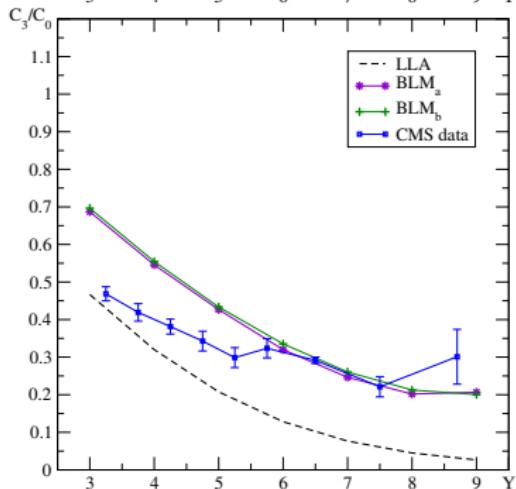

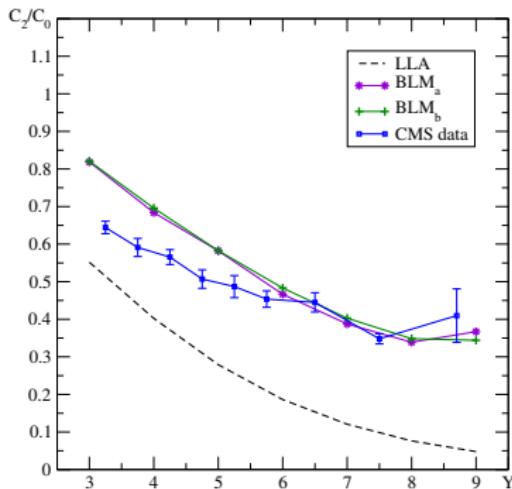

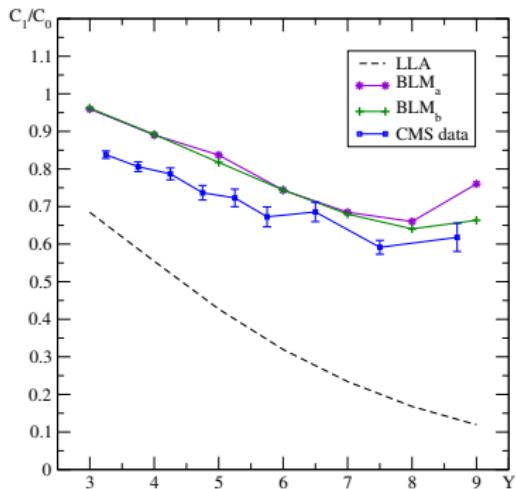

- Step 2: take the convolution with leading-twist PDFs

$$\sum_{a=q,\bar{q}} f_a \otimes (\text{quark jet vertex}) + f_g \otimes (\text{gluon jet vertex})$$

[J. Bartels, D. Colferai, G.P. Vacca (2003)]

[F. Caporale, D.Yu. Ivanov, B. Murdaca, A.P., A. Perri (2011)]

[D.Yu. Ivanov, A.P. (2012)] (small-cone approximation)

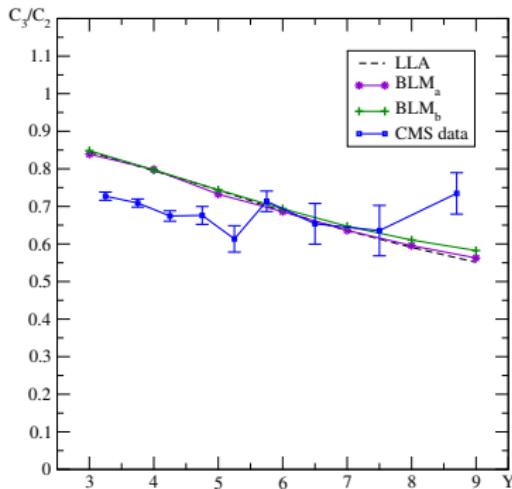

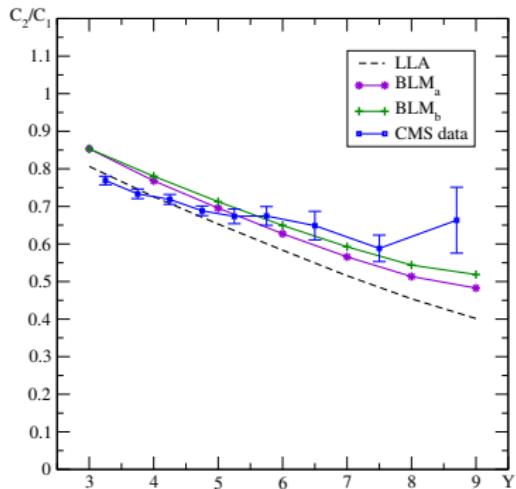

$$C_n/C_0 = \langle \cos[n(\phi_{J_1} - \phi_{J_2} - \pi)] \rangle$$

vs  $Y = y_{J_1} - y_{J_2}$

small-cone approximation  
BLM scale setting

□ CMS (7 TeV)

[F. Caporale, D.Yu. Ivanov, B. Murdaca,  
A.P. (2014)]

$$C_n/C_m = \frac{\langle \cos(n\phi) \rangle}{\langle \cos(m\phi) \rangle} \text{ vs } Y = y_{J_1} - y_{J_2}$$

[A. Sabio Vera (2006)]

[A. Sabio Vera, F. Schwennsen (2007)]

small-cone approximation  
BLM scale setting

□ CMS (7 TeV)

Similar results obtained with the exact jet vertices

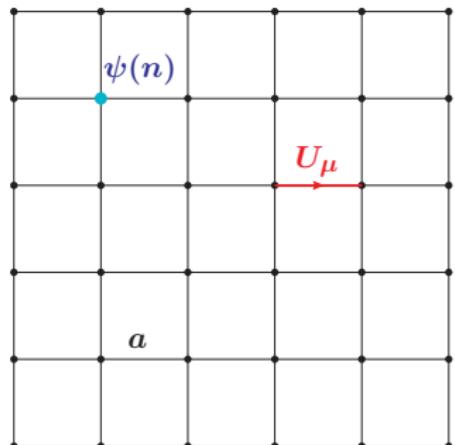

[B. Ducloué, L. Szymanowski, S. Wallon (2013,2014)]

# Path integral formalism

$$Z = \int D\bar{\psi} D\psi DA_\mu e^{iS_{\text{QCD}}} = \int D\bar{\psi} D\psi DA_\mu \exp \left[ i \int dt \int d^3 \vec{x} \mathcal{L}_{\text{QCD}} \right]$$
$$\langle \mathcal{O} \rangle = \frac{1}{Z} \int D\bar{\psi} D\psi DA_\mu \mathcal{O}[\bar{\psi}, \psi, A_\mu] e^{iS_{\text{QCD}}}$$

① Euclidean space-time:

$$t \rightarrow -i\tau, \quad iS_{\text{QCD}} \rightarrow -S_{\text{QCD}}^{(E)}$$

② space-time lattice (spacing  $a$ )

$\psi$  fields on **sites**, gauge fields on **links**

$$U_\mu(n) = \mathbb{P} \exp \left( ig \int_x^{x+\hat{\mu}a} dx^\mu A_\mu(x) \right)$$

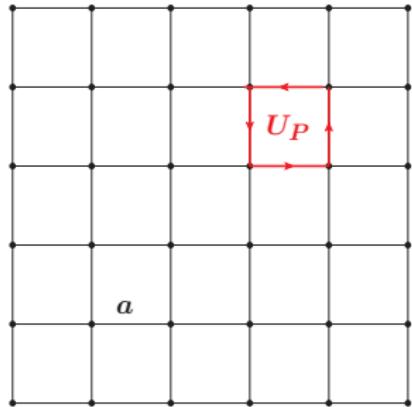

③  $Z \rightarrow \int D\bar{\psi} D\psi DU e^{-S_{\text{QCD}}^{(E)}}$

suitable for Monte-Carlo methods

Space-time lattice acts as a regulator, cutting off momenta above  $\sim 1/a$ .

Also non-perturbative physics gets accessible, just “measure” the appropriate  $\mathcal{O}$ .

# Lattice action

$$S_{\text{QCD}} = S_G[U] + S_F[U, \psi, \bar{\psi}]$$

$$U_{P,\mu\nu} = 1 + ig a^2 F_{\mu\nu} - \frac{1}{2} g^2 a^4 F_{\mu\nu} F^{\mu\nu} + \mathcal{O}(a^6)$$

$$S_G[U] = \frac{2N_c}{g^2} \sum_P \left[ 1 - \frac{1}{N_c} \operatorname{Re} \operatorname{Tr} U_P \right]$$

[Wilson (1974)]

$$g = g(a) \xrightarrow{a \rightarrow 0} 0$$

$$\begin{aligned} S_F &= \frac{1}{2} \sum_{n,\mu} \sum_{f=1}^{n_f} \left[ \bar{\psi}^f(n) \gamma_\mu U_\mu(n) \psi^f(n + \hat{\mu}) - \bar{\psi}^f(n + \hat{\mu}) \gamma_\mu U_\mu^\dagger(n) \psi^f(n) \right] \\ &+ a \sum_n \sum_{f=1}^{n_f} m_f \bar{\psi}^f(n) \psi^f(n) \end{aligned}$$

→ Doublers ( $n_f = 1 \implies 2^4$  fermions)

Ways out: staggered, Wilson, overlap, domain-wall or twisted-mass fermions

# Lattice setup

How to get to the continuum limit?

- Tune bare parameters ( $g(a)$ ,  $m_f(a)$ ) in the direction where  $a$  decreases, keeping the physics “constant”, e.g.

$$\left( \frac{m_\pi}{m_p} \right)_{\text{lat}} = \left( \frac{m_\pi}{m_p} \right)_{\text{exp}}$$

- **Scale fixing:** take a reference observable, e.g.  $m_p$ , “measure” it on the lattice for a choice of bare parameters and compare with the experimental value:

$$(m_p)_{\text{lat}} = a(m_p)_{\text{exp}} \quad \longrightarrow \quad a = a(g, m_f) = \frac{(m_p)_{\text{lat}}}{(m_p)_{\text{exp}}}$$

- Increase accordingly the number of lattice sites, to keep the **physical volume fixed** at a size large enough to accommodate the relevant physics.

Current best settings:

- $V_4 = (aN)^4$  ,  $N \lesssim \mathcal{O}(100)$  ,  $aN = (\text{a few}) \text{ fm}$  ,  $a \gtrsim 0.04 \text{ fm}$
- degenerate **up** and **down** quarks, with physical masses, plus physical **strange** plus (possibly) **charm** (2+1+1)

# Flux-tube anatomy - pure gauge case

$$E_x^{(NP)} = E_x - E_x^{(\text{Coulomb})}$$

[M. Baker *et al.*, Eur. Phys. J. C **80** (2020) 514 [[arXiv:1912.04739](https://arxiv.org/abs/1912.04739)]]

# String breaking in QCD

QCD with  $N_f = 2$  Wilson fermions  
 $r_{\text{break}} \simeq 1.25 \text{ fm}$

[G.S. Bali *et al.*, Nucl. Phys. B Proc. Suppl. **140** (2005), 609 [arXiv:hep-lat/0409137]]

# Partonic distributions

Formal definition:

$$q(x) = \int \frac{dz}{2\pi} e^{-ixP^+z} \langle P|\bar{\psi}(z) \underbrace{\frac{\gamma^+}{2}}_{\text{Wilson line}} \mathcal{A}[z, 0] \psi(0)|P\rangle, \quad P^+ = \frac{P^0 + P^3}{\sqrt{2}}$$

$z$  a light-cone vector, hard to implement on a lattice with finite spacing

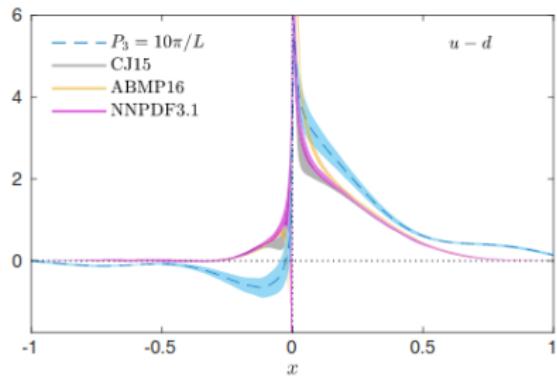

- Traditional approach: evaluate moments of partonic distributions  
signal-to-noise drops fast, only  $n = 3$  reachable, theoretical issues
- Recent development: express PDFs as Fourier transforms of equal-time correlators

Quasi-PDFs: the Fourier variable is  $z$  [X. Ji (2013)]

Pseudo-PDFs: the Fourier variable is  $P \cdot z$  ("Ioffe time"), dual to  $x_B$

[A. Radyushkin (2017)]

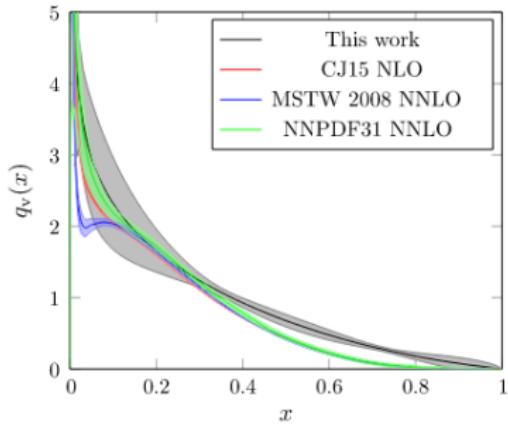

# Partonic distributions

Quasi-PDFs

$N_f = 2$  twisted Wilson fermions  
physical quark masses

[C. Alexandrou *et al.*, Phys. Rev. D **99** (2019)  
114504 [arXiv:1902.00587]]

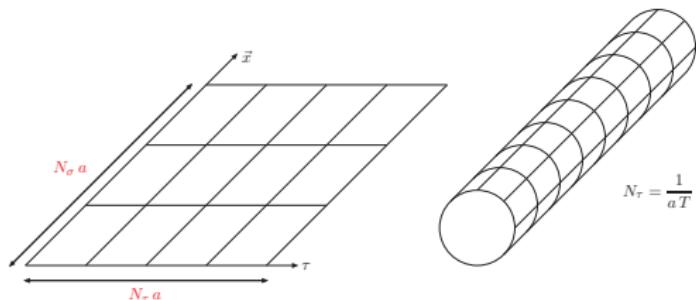

Pseudo-PDFs

QCD with 2+1 Wilson fermions  
extrapolated to physical quark mass

[B. Joo *et al.*, Phys. Rev. Lett. **125** (2020)  
232003 [arXiv:2004.01687]]

# QCD at non-zero temperature

(Anti-)periodic boundary conditions:

$$U_\mu(\vec{n}, 0) = U_\mu(\vec{n}, N_\tau)$$

$$\psi(\vec{n}, 0) = -\psi(\vec{n}, N_\tau)$$

$$Z^{(E)} = \int D\bar{\psi} D\psi DU \exp \left[ - \int_0^T d\tau \int d^3 \vec{x} \mathcal{L}^{(E)} \right], \quad \beta \equiv \frac{1}{aN_\tau}$$

- $m_q \rightarrow \infty$ : breaking of the **center** symmetry,  $Z(N_c)$ ;  $T_d \approx 260$  MeV

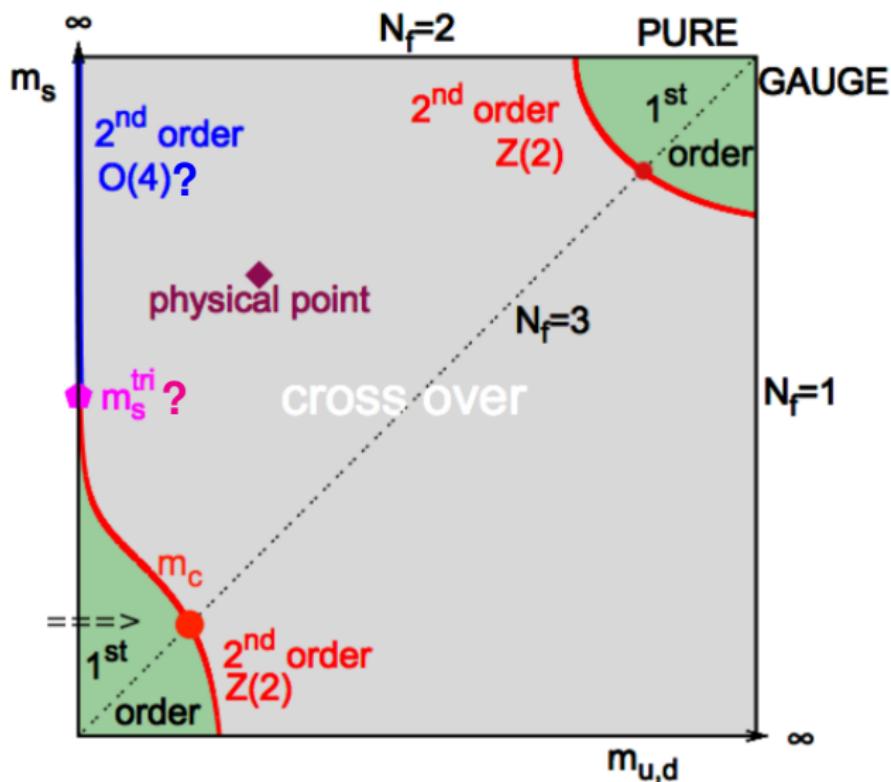

$$P(\vec{n}) = \text{Tr} \prod_{n_4=1}^{N_\tau} U_4(\vec{n}, n_4), \quad e^{-\beta F_q} = \langle P(\vec{n}) \rangle = \langle L \rangle$$

$T < T_d$  :  $\langle L \rangle = 0$  confinement;     $T > T_d$  :  $\langle L \rangle \neq 0$  deconfinement

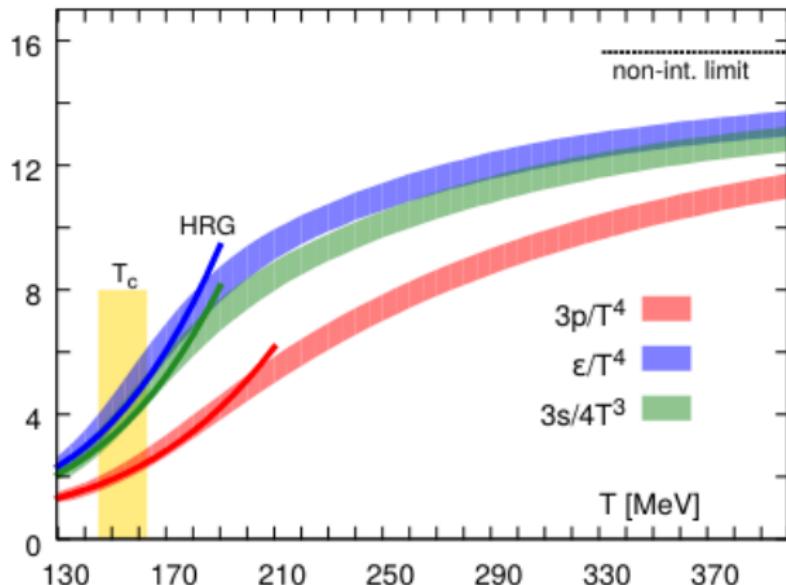

- $m_q \rightarrow 0$ : breaking of the **chiral** symmetry;

$T < T_{ch}$  :  $\langle \bar{\psi}\psi \rangle \neq 0$  broken symm.;     $T > T_{ch}$  :  $\langle \bar{\psi}\psi \rangle = 0$  restored symm.

# QCD at non-zero temperature: Columbia plot

# QCD equation of state

(2+1)-QCD with physical-mass staggered fermions

[HotQCD Collaboration, Phys. Rev. D **90** (2014) 094503, [arXiv:1407.6387]]

High-temperature QCD matter (quark-gluon plasma) as a low-viscosity fluid.

# QCD at non-zero baryon density

Take, for simplicity,  $n_f = 1$ :

$$Z^{(E)}(T, \mu) = \text{Tr} \exp \left[ -\frac{H - \mu \hat{N}}{T} \right], \quad \hat{N} = \int d^3 \vec{x} J^0, \quad J^\mu = \bar{\psi} \gamma^\mu \psi$$

$\hat{N}$  quark number operator; its eigenvalues give the excess of quarks over anti-quarks.

$$\mathcal{L}_{\text{QCD}}(\mu) \rightarrow \mathcal{L}_{\text{QCD}} + \mu J^0$$

$$Z^{(E)}(T, \mu) = \int D\mathbf{U} D\bar{\psi} D\psi e^{-S_F[U, \psi, \bar{\psi}, \mu] - S_G[U]}$$

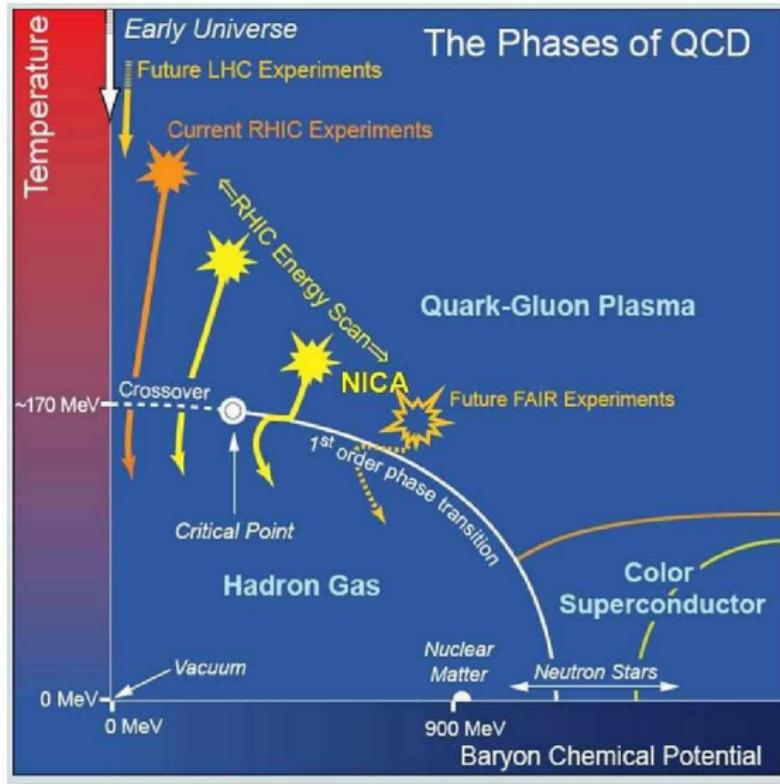

$$S_F = \sum_{n,m} \bar{\psi}(n) M_{nm}(\mu) \psi(m), \quad \int D\bar{\psi} D\psi e^{-S_F[U, \psi, \bar{\psi}, \mu]} = \det M(\mu)$$

$$Z^{(E)}(T, \mu) = \int D\mathbf{U} e^{-S_{\text{eff}}[U]}, \quad S_{\text{eff}}[U] = S_G[U] - \ln \underbrace{\det M[U, \mu]}_{\text{complex for } \mu \neq 0}$$

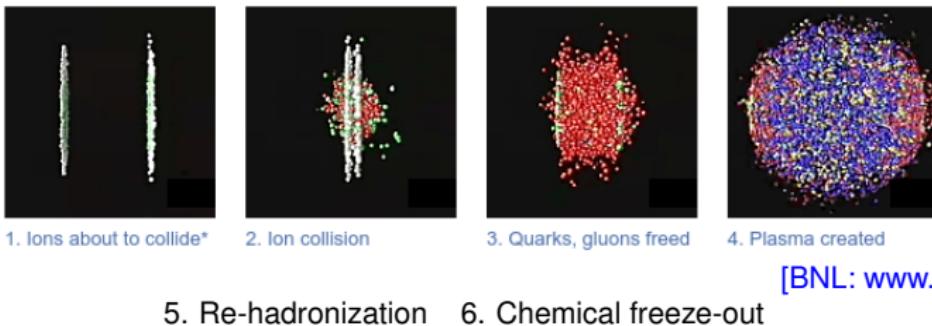

**Sign problem!** Monte-Carlo methods unfeasible.

Ways out: reweighting, Taylor expansion around  $\mu = 0$ , imaginary chemical potential, field complexification, dual transformations, ...

## QCD phase diagram

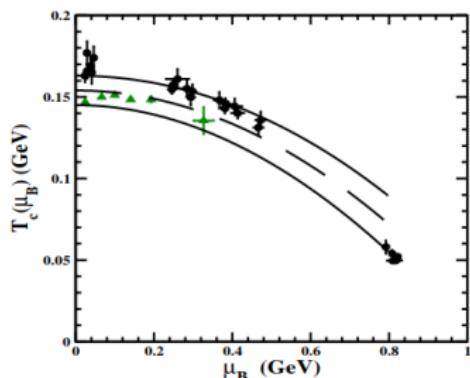

# QCD phase diagram: heavy-ion collisions

[BNL: [www.bnl.gov](http://www.bnl.gov)]

Thermo-statistical models can describe particle abundances in terms of  $T$  and  $\mu$

Lattice data (critical line):  
(2+1)-QCD with almost physical  
staggered fermions,  
 $\mu_u = \mu_d = \mu_s$

Exp. data (freeze-out, BNL):  
AGS (black), STAR (green)

# Conclusions

QCD is a fascinating, multi-faceted theory, answering many questions in hadron physics, but posing also hard challenges.

It is the ideal place for creative minds.

# Acknowledgments

- Previous QCD lectures at this school, in particular those from I. Ivanov (2010) and D. Ivanov (2019) have been useful guidelines for mine.
- Many figures and plots were taken either from the Particle Data Group web site [<https://pdg.lbl.gov>] or from Wikipedia.
- Most Feynman diagram were drawn with the help of the interface JaxoDraw [Binosi *et al.*, *Comput. Phys. Commun.* **180** (2009) 1709 [[arXiv:0811.4113 \[hep-ph\]](https://arxiv.org/abs/0811.4113)]].
