

Doubled geometries as generalized bimetric gravity models

Tuesday, 12 October 2021 10:45 (15 minutes)

The non-product noncommutative spectral geometry allows for several generalizations of the classical general relativity. In particular, doubled geometry models possesses features characteristic to bimetric gravity theories. In my talk I will describe such models for the pair of Friedmann–Lemaître–Robertson–Walker metrics and discuss stability of possible solutions in several cosmological scenarios.
