

## Study of spectator charge distributions in the HADES experiment for Ag+Ag@1.58AGeV and Au+Au@1.23AGeV

*Monday, 11 October 2021 11:45 (15 minutes)*

Fragments charge has been measured with the forward hodoscope (FWall) in the HADES experiment for Ag+Ag@1.58AGeV and Au+Au@1.23AGeV. First results on the nuclei fragments description with the framework of the DCM-QGSM-SMM model and comparison with the experimental data will be presented. The description of the fragments' charges with the model is a crucial task for centrality determination and geometrical properties of the nucleus-nucleus collisions.
