## Crystal and magnetic structure investigation of half-Heusler compounds MnNi0.9M0.1Sb (M = Ti, V, Cr, Fe, Co)

Tuesday, 12 October 2021 16:30 (15 minutes)

Half-Heisler magnetic intermetallic compounds of transition metals exhibit interesting physical properties such as magnetoresistance, ferromagnetic and antiferromagnetic magnetic states, and superconductivity. It is observed the shape memory effect and superelasticity with opportunity to control there phenomena by means magnetic field. It makes these compounds promising materials to apply for creation permanent magnets, elements of electronic devices and cooling technology.

To understand the formation of magnetic states in doped half-Heusler compounds based on MnNiSb it is necessary to correctly separate the contribution to the magnetic properties from the sublattices of nickel and manganese ions and to identify the relationship between the structural and magnetic properties of these materials.

In our work we present the results of investigation the crystal and magnetic structure of half-Heusler intemetallic compounds MnNi0.9M0.1Sb (M = Ti, V, Cr, Fe, Co) by means of neutron diffraction under normal conditions. Partial substitution of another transition element for nickel leads to a decrease in the magnetic moment of the Mn ions. Also MnNiSb, MnNi0.9Cr0.1Sb and MnNi0.9Fe0.1Sb compounds have been studied in the temperature range from 13 to 300 K. It has been found that the initial cubic structure F-43m and ferromagnetic phase remain in the investigated temperature range. New reflections corresponds to the antiferromagnetic phase have not been found.

This work have been supported by the Russian Foundation for Basic Research, project no. 20-52-04003 Bel\_mol\_a (Belarusian Foundation for Basic Research, project no. T21RM-029 ).
