Presentation: <https://ndmspc.gitlab.io/slides/jinr/nica/20211223>

## CURRENT MPDROOT USAGE

- On Desktop/Notebook
  - prepare (any) linux based computer and install prerequisites
  - install FairSoft + FairRoot
  - build MPDRoot
  - optionally install MPDRoot (almost no-one uses this option)
  - start working with MPDRoot (after 2+ hours of initial setup)
- On HybriLIT
  - module add FairRoot/v18.2.1 (newer don't work)
  - add any more required modules (guessing game)
  - build MPDRoot
  - ..

## PROBLEMS WITH CURRENT APPROACH

- too much effort to prepare MPDRoot environment for regular users (physicist) - users tend to use same old version of MPDRoot for long time
- mixed versions of installed dependencies on users computers
- hard to keep track on dependencies
- projects on which MPDRoot depends are installed inside MPDRoot instead of being linked to
- macro directory contains users (non-general) macros as well as unsupported ones
- macros rely on variable \$VMCWORKDIR shared across multiple FairRoot-based projects

# New Approach

# USER - VIA CLUSTER

## LOG-IN (ALWAYS)

```
ssh username@hydra.jinr.ru
source /cvmfs/nica.jinr.ru/sw/os/login.sh
module add mpdroot
```

## USAGE

```
root -b -q $MPDROOT_MACROS/common/runMC.C
```

## AVAILABLE VARIABLES

```
$MPDROOT - main installation (not source) directory
$MPDROOT_MACROS - directory containing example macros ($MPDROOT/macros)
$GEOMPATH - path to geometry directory
$CONFIG_DIR - gconfig
```

## DEPRECATED

```
$VMCWORKDIR - still available but can be removed later
```

# LOCAL INSTALLATION

```
bash <(curl -s https://git.jinr.ru/nica/nicadist/-/raw/master/scripts/nica-init.sh)
```

- Script will install
  - cvmfs
  - podman
  - toolbox
- OS supported
  - Fedora 34, 35
  - CentOS 7, 8
  - Debian 11
  - Ubuntu 18.04, 20.04, 21.10
  - Mint 20.2
  - Pop!\_os 20.04

# DESKTOP/NOTEBOOK

## START CVMFS

```
sudo systemctl start cvmfs # one-time start of cvmfs before usage  
sudo systemctl enable cvmfs # start cvmfs on boot
```

## USAGE

```
toolbox enter c7-nica-dev  
module add mpdroot  
root -b -q $MPDROOT_MACROS/common/runMC.C
```

# DEVELOPMENT ON DESKTOP/NOTEBOOK WITH CVMFS INITIALIZATION

```
sudo systemctl start cvmfs # one-time start of cvmfs before usage
toolbox enter c7-nica-dev
module add mpddev
```

## FIRST TIME CONFIGURATION

```
git checkout https://git.jinr.ru/nica/mpdroot
mkdir mpdroot/build && cd mpdroot/build
export $MPDROOT=/path/to/install
cmake ..
```

## BUILD

```
make -j5 install
```

## TEST RUN

```
source $MPDROOT/etc/env.sh
root -b -q $MPDROOT_MACROS/common/runMC.C
```

# DEVELOPMENT - VIA CLUSTER

## LOG-IN (ALWAYS)

```
ssh username@hydra.jinr.ru
source /cvmfs/nica.jinr.ru/sw/os/login.sh
module add mpddev
```

## FIRST TIME CONFIGURATION

```
git checkout https://git.jinr.ru/nica/mpdroot
mkdir mpdroot/build && cd mpdroot/build
export $MPDROOT=/path/to/install
cmake ..
```

## BUILD

```
make -j5 install
```

## USAGE

```
source $MPDROOT/etc/env.sh
root -b -q $MPDROOT_MACROS/common/runMC.C
```

# MPDROOT VIA ALIBUILD

## FIRST TIME CONFIGURATION

```
mkdir $HOME/nica  
cd $HOME/nica  
git clone https://gitlab-hlit.jinr.ru/nica/nicadist.git alidist  
toolbox create -c c7-nica-dev -i registry.gitlab.com/ndmspc/user/c7:alibuild-dev
```

## BUILD OF MPDROOT

```
toolbox enter c7-nica-dev  
cd $HOME/nica  
aliBuild build mpdroot --debug
```

## USAGE

```
cd $HOME/nica  
alienv enter mpdroot/latest
```

## PROPOSED NEW APPROACH TO BUILD

- build system based on aliBuild - <https://alisw.github.io/alibuild>
- each package has a configuration script - "recipe" which describes its build process and dependencies
- NICAdist project - <https://git.jinr.ru/nica/nicadist> - fork of alidist with additions towards NICA reusing most of the recipes (e.g. FairRoot) from alibuild
- added scripts necessary for MPDRoot (e.g., Eigen3, mpddev)
- (almost) all packages are built from sources (including compiler and basic tools like CMake, libSSL, libXML2) - currently 35 packages
- build process runs inside minimalistic containers - CentOS7 and CentOS8 supported by us
- for each package we can trace back packages versions as well used base operating system - we can restore any version
- if some package changes, all dependent packages are rebuilt automatically

## HOW BUILD PROCESS WORKS

- trigger
  - tag with <tag\_name> created in **mpdroot**
  - push to dev branch
- build pipeline is triggered automatically in nicadist project - WIP
- package **mpdroot** is build on CentOS7 and CentOS8 and deployed to cvmfs
- deploy **mpdroot** to `/cvmfs/nica.jinr.ru`
  - tags: `/cvmfs/nica.jinr.ru/sw/slcz*`
  - dev branch: `/cvmfs/nica.jinr.ru/sw/tmp/slcz*`

## ADVANTAGES

- any NICA project (BM@N, SPD) can join - one needs only to create proper recipe files
- if necessary, defaults can be fixed according to the project needs (e.g. each project can use different FairRoot version)
- it is easy to test build with upcommig versions of dependent projects
- it is easy to link multiple projects (split them to parts reusable by individual software packages)
- possibility of creating user specific tags

## SUMMARY

- We use alibuild as base for our build system
- NICAdist fork of aliDist project was created
- automatic build pipelines
- multiple OS supported via toolbox
- supported MPDRoot modes
  - user - via cvmfs (locally or on server)
  - developer - dependencies via cvmfs
  - developer - build from scratch via alibuild
- documentation <http://nica.pages.jinr.ru/nicadist/> - WIP
