The XXVI International Scientific Conference of Young Scientists and Specialists (AYSS-2022)

Dubna, JINR, 24 – 28 October 2022

Ecosystem for ML/DL/HPC tasks

HPCLab component

High Performance Computing

VM with JupyterHub and SLURM [<https://jlabhpc.jinr.ru>]

- ❑ Intel Xeon Gold 6126 (24 Cores @ 2.6 GHz)
- ❑ 32 GB RAM

Educational component

JupyterLab Server [<https://studhub.jinr.ru>]

- ❑ 2x Intel Xeon Gold 6152 (22 Cores @ 2.1 GHz)
- ❑ 512 GB RAM

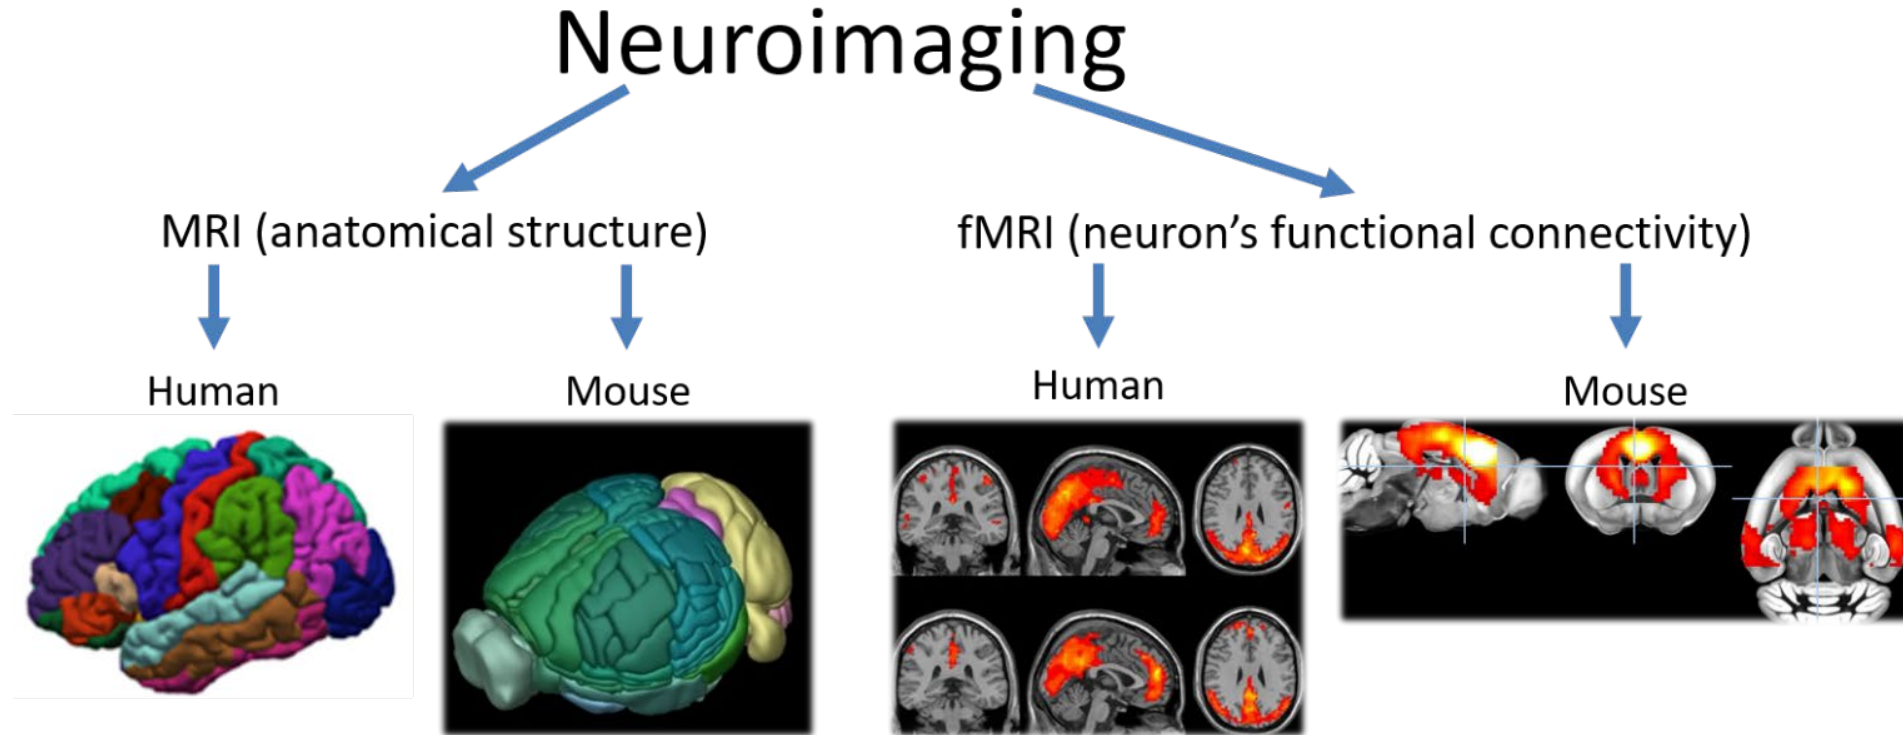

Computation component

Server with NVIDIA Volta [<https://jhub2.jinr.ru>]

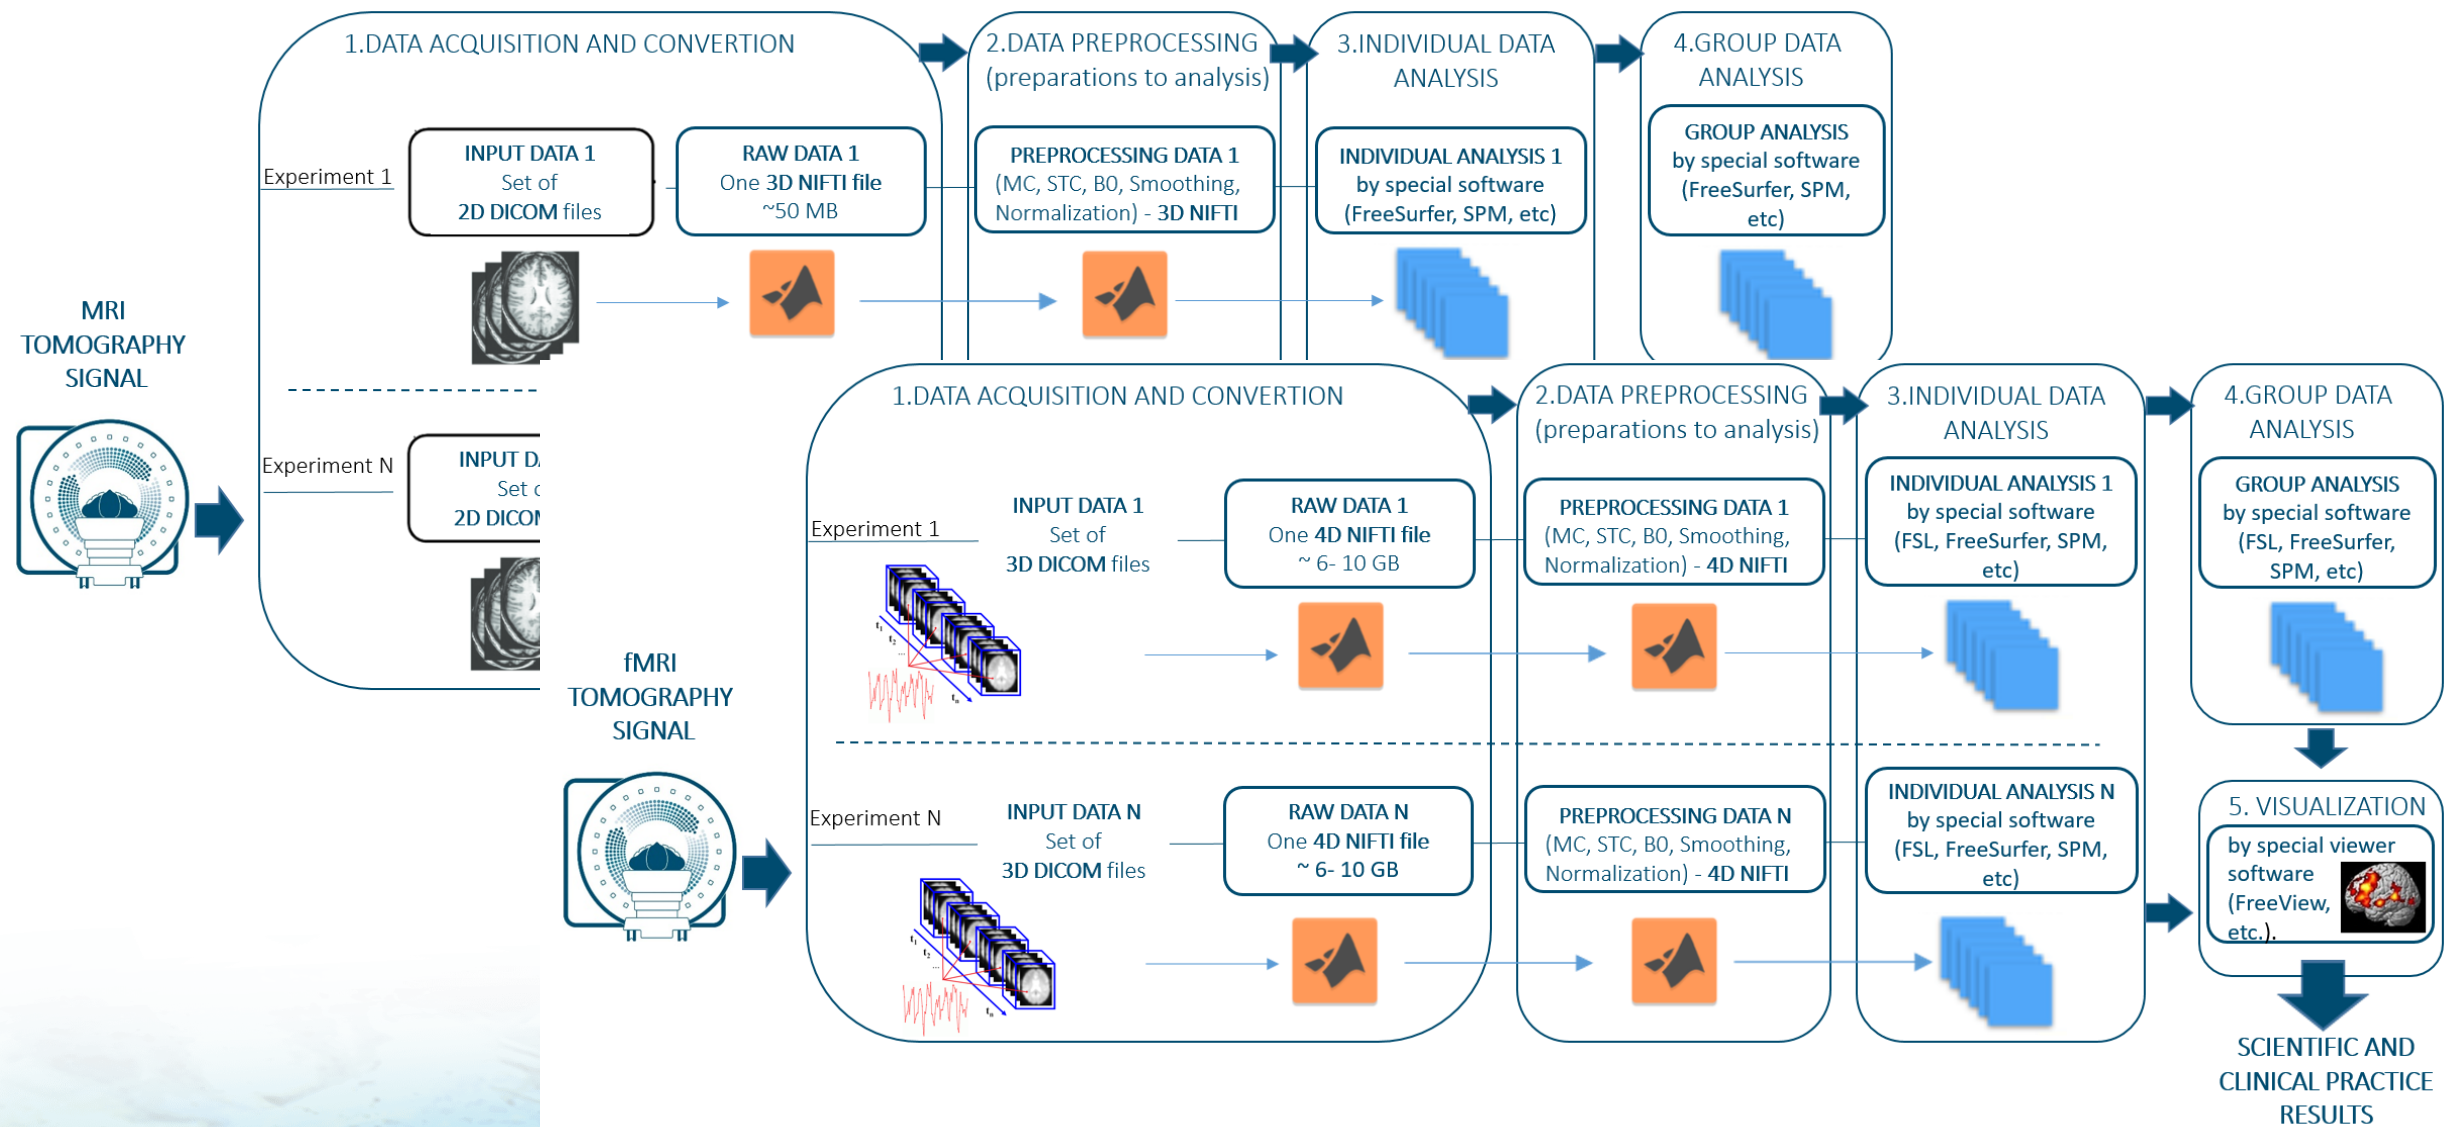

- ❑ 2x Intel Xeon Gold 6148 (20 Cores @ 2.4 GHz)
- ❑ 4x NVIDIA Tesla V100 SXM2 32 GB HBM2
- ❑ 512 GB RAM

Workflow for Analyzing Experimental MRI/fMRI Data

Scientific field

The study of the anatomical structure and functional neuronal activity of the brain is an actual task of modern neurobiology. At present, MRI and fMRI are considered the most effective methods of neuroimaging. The modern equipment allows conducting non-invasive experiments of these types for both humans and laboratory animals (monkeys, mice, etc.). The discovery of these methods has provided new opportunities for neurobiologists. In particular, the use of MRI/fMRI methods enables long-term research of the brain, human or laboratory animals.

Workflow for Analyzing Experimental MRI/fMRI Data

Software and work installed packages

Algorithm for users

1. Authorization in the system
2. Downloading the DICOM catalog
3. Converting the DICOM directory to a NIFTI file and a TXT experiment metadata file
4. Processing the NIFTI file by specialized software (FreeSurfer or FSL)
5. Visualization of results

List of installed packages

- ☐ **MRI Convert** for converting the NIFTI file from the original set of DICOM files;
- ☐ **FreeSurfer** for NIFTI file processing;
- ☐ **FreeView** for building images after NIFTI file processing;
- ☐ **FSL**, alternative package for NIFTI file processing;
- ☐ **FSLeyes** (viewer from the FSL package) for building images after NIFTI file processing.

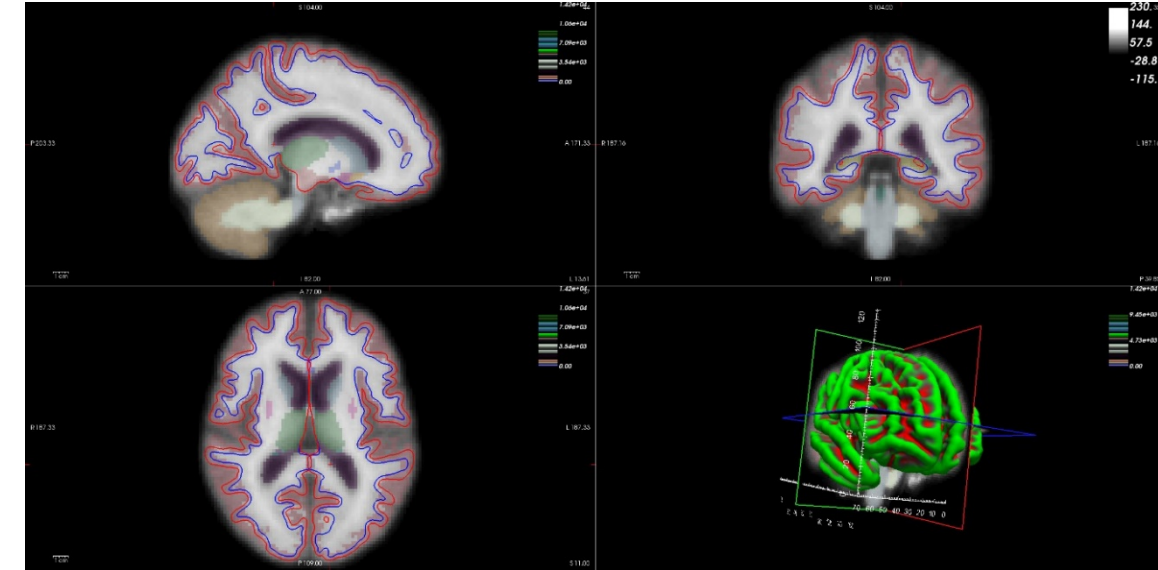

Using the parallelization, the processing time was reduced by **3 times**.

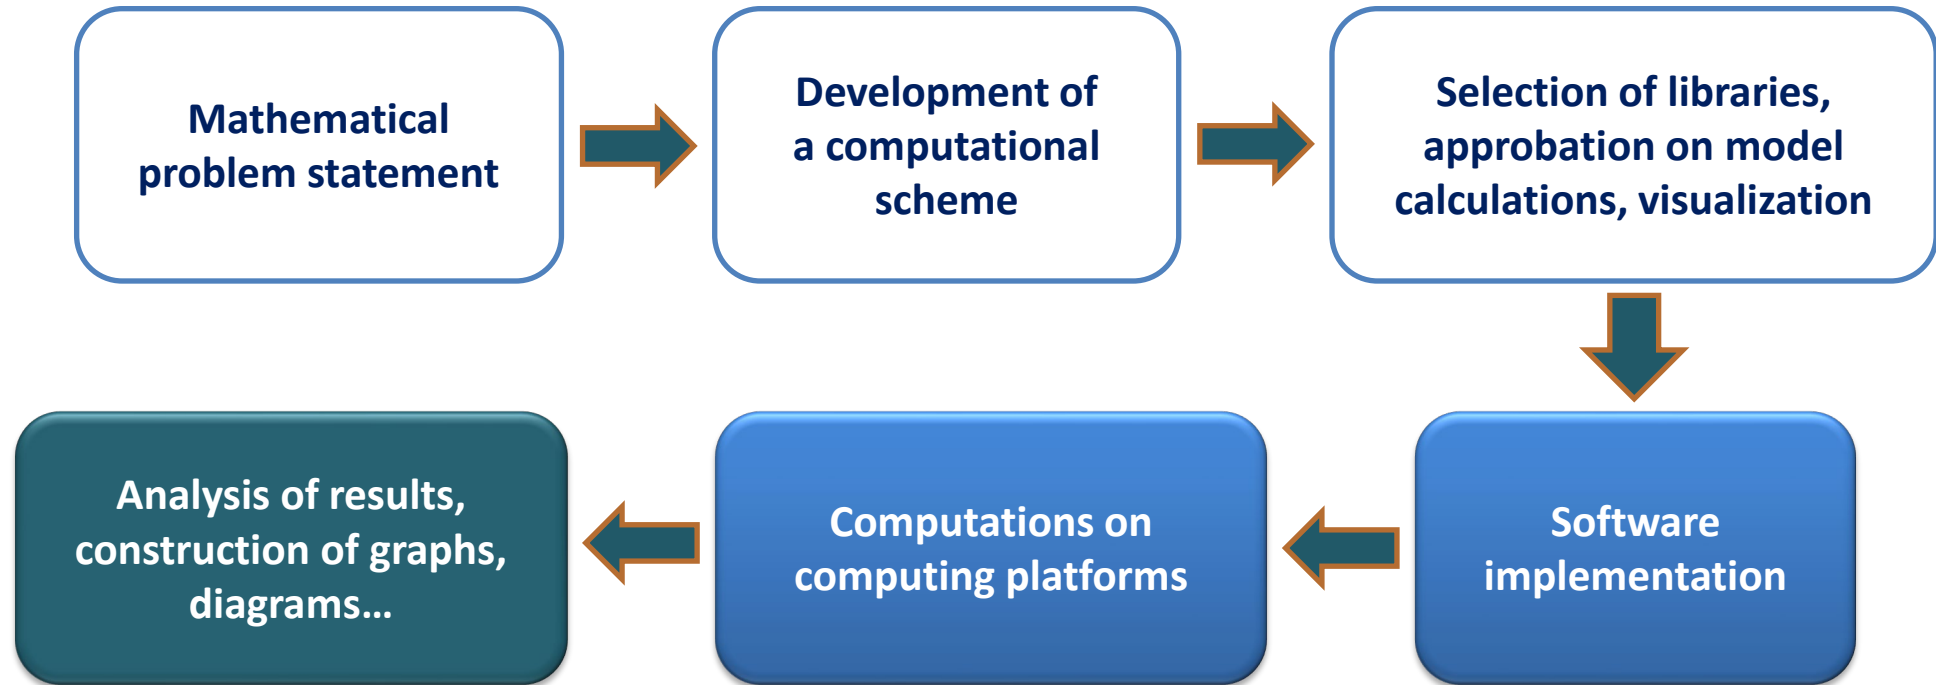

Workflow for Analyzing Experimental MRI/fMRI Data

Numerical research process

The creation of a toolkit that allows one to carry out computations, to visualize the results within a single application, and perform the most resource-intensive calculations in parallel is an urgent task.

The *Jupyter Notebook* environment provides this capability.

Python Numerical Methods

pythonnumericalmethods.berkeley.edu

jupyter {book}

matplotlib

pandas

K Keras

NumPy

seaborn

Symbolic computations block

$$\gamma_{m_i} = -\frac{\mu_0}{2\Phi_0} \int d\mathbf{r}_i \frac{\mathbf{M}_i \times \mathbf{r}_i}{r^3}$$

$$B_{12}(r_{12}, m_1) = \frac{\mu_0}{4\pi} \left(\frac{3(m_1 \cdot \hat{r})\hat{r}}{b^5} - \frac{m_1}{b^3} \right)$$

SymPy is a Python library for symbolic mathematics.

matplotlib is a main library for building graphs, diagrams in Python.

Block of numerical computations and analysis

```
f = partial(my_sfs, G=G, alpha=alpha, k=k, \
            OmegaF=OmegaF, V=V)
#t_e = np.arange(0, 25, 0.0001)
t_e=np.linspace(t0,tf,100000)

s0 = np.array([0, 1, 0])
sol_1=solve_ivp(f,[t0,tf],s0, t_eval=t_e, method='RK45')
```

SciPy is an open-source software for mathematics, science, and engineering.

Parallelization of multi-parameter computations

Joblib is a set of tools to provide lightweight pipelining in Python

Problem to study the dynamics of magnetization in a Phi-0 Josephson Junction (SFS structure)

Collaboration with Ilhom Rahmonov (Bogoliubov Laboratory of Theoretical Physics, JINR)

The dynamics of the magnetic moment M of the system under consideration is described by the Landau-Lifshitz-Gilbert equation:

$$\begin{aligned}\frac{dm_x}{dt} &= -\frac{1}{1 + M^2 \alpha^2} \{m_y H_z - m_z H_y + \alpha[m_x(M, H) - H_x]\}, \\ \frac{dm_y}{dt} &= -\frac{1}{1 + M^2 \alpha^2} \{m_z H_x - m_x H_z + \alpha[m_y(M, H) - H_y]\}, \\ \frac{dm_z}{dt} &= -\frac{1}{1 + M^2 \alpha^2} \{m_x H_y - m_y H_x + \alpha[m_z(M, H) - H_z]\},\end{aligned}$$

$M = [m_x, m_y, m_z]$ are the magnetic moment components; the effective field components $H = [H_x, H_y, H_z]$ depend on the Josephson phase difference ϕ and are defined as follows:

$$\begin{aligned}H_x(t) &= 0, \\ H_y &= Gr \sin(\phi(t) - tm_y(t)), \\ H_z(t) &= m_z(t).\end{aligned}$$

Model parameters:

G – ratio of the Josephson energy to the magnetic anisotropy energy;
 r – spin-orbit interaction constant;
 α – Hilbert dissipation parameter;
 in this study $w = 1$.

The equation for the Josephson phase difference $\phi(t)$ is determined from the equation for the electric current I flowing through the Josephson junction, measured in units of the critical current I_c :

$$\frac{d\phi}{dt} = -\frac{1}{w} \left(\sin(\phi - rm_y) + r \frac{dm_y}{dt} \right) + \frac{1}{w} I,$$

Calculations for different values of parameters

To analyze the possibility of reversing the magnetic moment of the ϕ_0 -Josephson junction at different values of the parameters, we will carry out calculations for $G=8.9$.

```
from scipy.integrate import solve_ivp
from functools import partial
```

```
G=9
f = partial(my_sfs, G=G, r=r, alpha=alpha, \
            As=As, t_s=t_s, delta_t=delta_t)
#t_e = np.arange(0, 25, 0.0001)
t_e=np.linspace(0,60,1000)

s0 = np.array([0, 0, 1, 0])
sol_2=solve_ivp(f,[0,60],s0, t_eval=t_e) # method = 'Radau'
```

```
plt.figure(figsize = (8, 6))
plt.plot(t_e,y_I, label= 'Rectangular current pulse')
plt.plot(sol_1.t, sol_1.y[2], label= 'Componet $m_z$ $ at G=8' )
plt.plot(sol_2.t, sol_2.y[2], label= 'Componet $m_z$ $ at G=%4.2f' %G)
plt.xlabel('t', size=16)
plt.ylabel('$m_z(t)$', size=16)
plt.legend(fontsize=12)
plt.show()
```

```
#plt.figure(figsize = (8, 6))
fig, ax1 = plt.subplots(figsize=(8, 8))
# mask out the negative and positive values, respectively
#Zpos = np.ma.masked_less(alpG[:,0], 0)
Z1 = Zc.reshape(N, N)
plt.imshow(Z1, interpolation='bilinear', cmap='Blues')
#plt.contourf(X, Y, Zc, 100)
#fig.colorbar(Zc, ax=ax1)
plt.show()
```

Define a function called by each process

```
from joblib import Parallel, delayed
import numpy as np

def funk_parall(k):
    i=k%N
    j=k//N
    mz_sol=0
    G=G0+delta_G*i
    alpha=alpha0+delta_alpha*j
    f = partial(my_sfs, G=G, r=r, alpha=alpha, \
                As=As, t_s=t_s, delta_t=delta_t)
    t_e=np.linspace(0,60,1000)
    s0 = np.array([0, 0, 1, 0])
    sol_i=solve_ivp(f,[0,60],s0, t_eval=t_e) # method = 'Radau'
    if sol_i.y[2][999] < 0:
        mz_sol= -1
        # alpGxy[i+j*N,2] -= 1
    return mz_sol
```

Serial mode calculation

```
t0 = time.time()
rez= Parallel(n_jobs=1)\
    (delayed(funk_parall)(k) for k in range(N*N) )
t1 = time.time()
print(f'Execution time {t1 - t0} s')
```

Execution time 159.9254457950592 s

Computing in Parallel Mode

```
t0 = time.time()
rez= Parallel(n_jobs=6)\
    (delayed(funk_parall)(k) for k in range(N*N) )
t1 = time.time()
print(f'Execution time {t1 - t0} s')
```

Execution time 34.51503801345825 s
