

# Spin nature of the energy gap in superconductors of the second kind

G. Y. Krugan, A. V. Matasov

NATIONAL RESEARCH UNIVERSITY «MOSCOW POWER ENGINEERING INSTITUTE»

## Introduction

The paper discusses the estimation of the second critical field through a superconducting gap.

The second critical field is evaluated in two ways.

- The first one is thermodynamical. There is a Clogston's estimation of the second critical field  $H_{c2} = 1,84 \cdot T_c$

- The second one is coherence length. There is an expression  $H_{c2} = \frac{\Phi_0}{2\pi\xi^2}$ ,

where  $\Phi_0 = \frac{\pi\hbar c}{e}$  — quantum of magnetic flow,  $\xi$  — coherence length.

In this work an estimate of the field is obtained with Zeeman's effect of splitting energy levels of cooper pairs.

## Methodology

In essence, 4 quantum states of paired electrons are possible, differing in spin projections, forming an orthonormal basis in the state space:

$$\begin{aligned} &|++\rangle \\ &|+-\rangle \\ &|-+\rangle \\ &|--\rangle \end{aligned}$$

To characterize the state of an isolated system of two electrons, we introduce the Hamilton operator. In the model we consider difference in energies due to spin only with magnetic field:

$$\hat{H} = A\hat{\sigma}_1\hat{\sigma}_2 - \mu_{B1}\sigma_1B - \mu_{B2}\sigma_2B, \text{ where}$$

$\hat{\sigma}_1, \hat{\sigma}_2$  — spin operators for both particles and

$\mu_{B1}, \mu_{B2}$  — Bohr magnetons for both particles,

$A = \frac{\Delta}{4}$  the energy difference of the two states with  $B = 0$ .

Due to the orthogonality of the basis vectors to each other, we have the following matrix:

$$H = \begin{pmatrix} A - \mu_{B1}B - \mu_{B2}B & 0 & 0 & 0 \\ 0 & -A - A(\mu_{B1} - \mu_{B2})B & 2A & 0 \\ 0 & 2A & -A + A(\mu_{B1} - \mu_{B2})B & 0 \\ 0 & 0 & 0 & A + \mu_{B1}B + \mu_{B2}B \end{pmatrix}$$

We are looking for a solution to the Schrodinger's equation in the form  $\Psi(\vec{x}, t) = \psi(\vec{x}) \cdot e^{-i\omega t}$ . Then our task is reduced to stationary and we obtain the following distribution of energy by states:

$$E_1 = A - (\mu_{B1} + \mu_{B2})B \text{ for } |1\rangle = |++\rangle$$

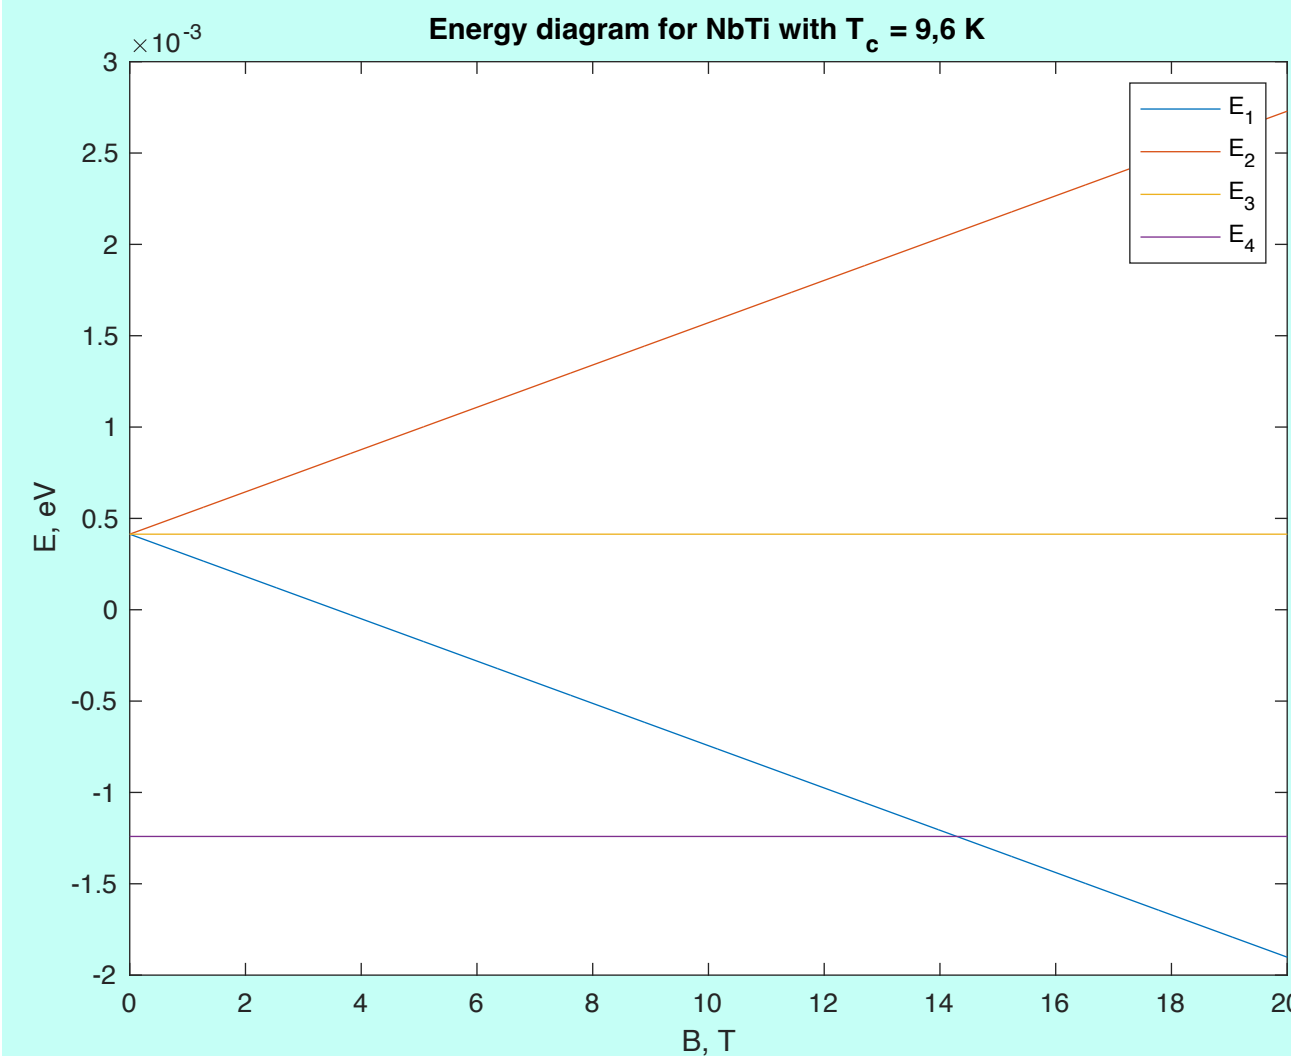

$$E_2 = A + (\mu_{B1} + \mu_{B2})B \text{ for } |2\rangle = |--\rangle$$

$$E_3 = A(-1 + 2C) \text{ for } |3\rangle = \frac{1}{\sqrt{2}}(|+-\rangle + |-+\rangle)$$

$$E_4 = -A(1 + 2C) \text{ for } |4\rangle = \frac{1}{\sqrt{2}}(|+-\rangle - |-+\rangle),$$

$$\text{where } C = \sqrt{1 + (\mu_{B1} - \mu_{B2})^2 \cdot \frac{B^2}{4A^2}}.$$

## Results

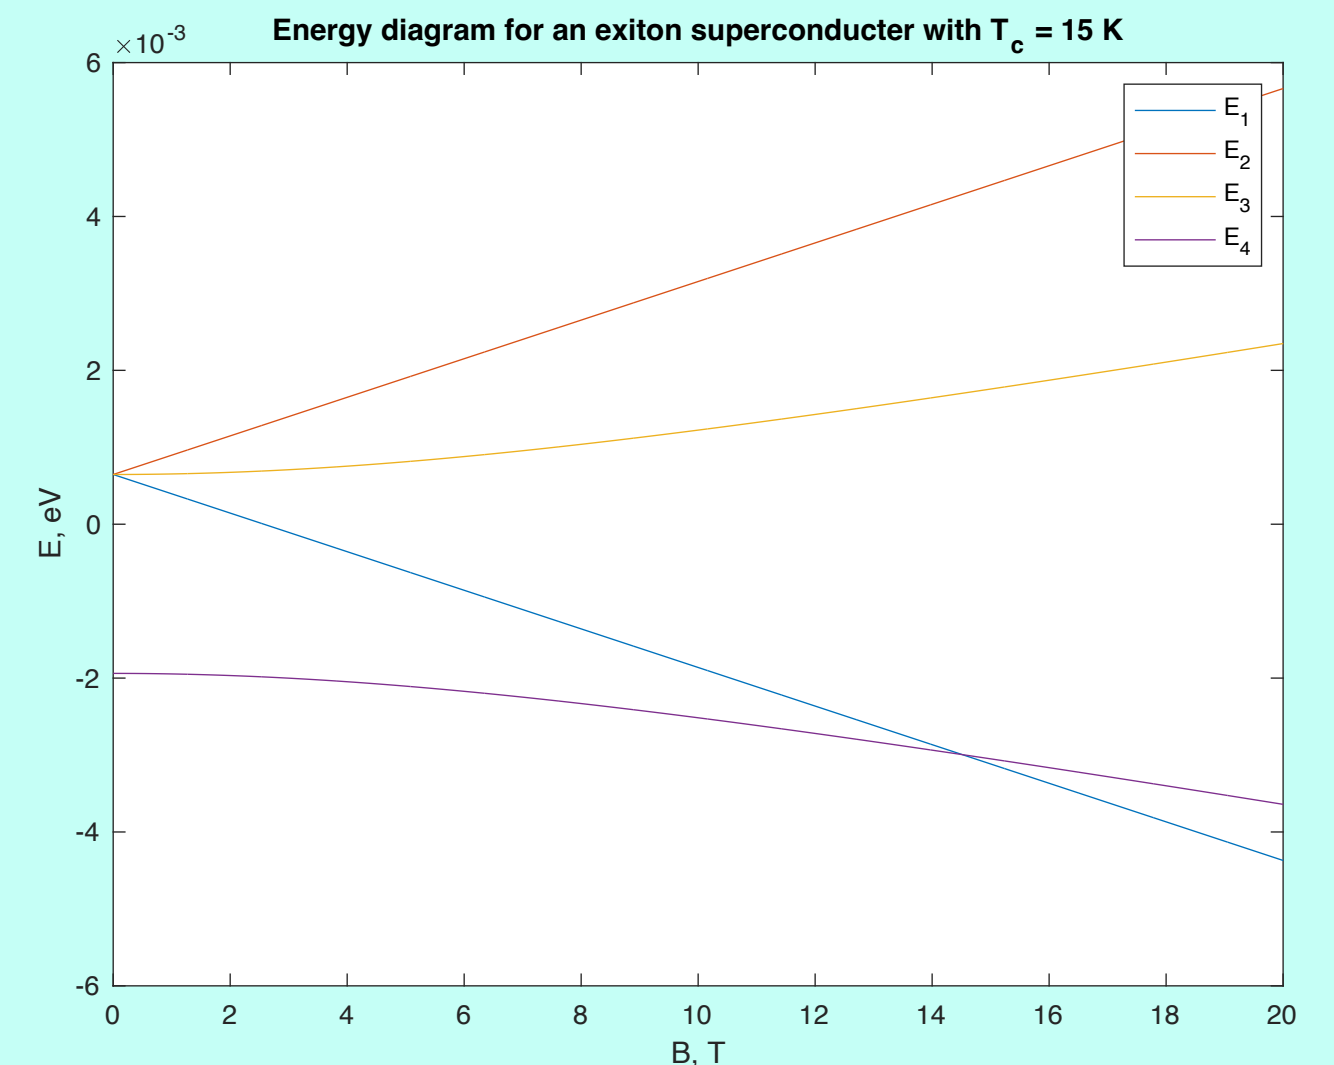

Thus, we offer to estimate the second critical field  $B_{c2}$  through the intersection of the curves  $E_1$  and  $E_4$  of the energy diagram like curves of two different energy conditions with  $B = 0$ . If you equate energy curves and try to find the point of their intersection, you can find out a new estimate for the second critical field:

$$B_{c2} = A \frac{(\mu_{B1} + \mu_{B2})}{\mu_{B1}\mu_{B2}}$$

## Superconducting materials. Estimate with $\Delta = 2kT_c$

Material	$T_c$ , K	$B_{c2}^{theor}$ , T	$B_{c2}^{exper}$ , T
NbTi	9,6	14,29	14
Nb <sub>3</sub> Ge	23,2	34,54	38
Nb <sub>3</sub> Sn	18,3	27,23	24
La <sub>1,85</sub> Sr <sub>0,15</sub> CuO <sub>4</sub>	38	56,55	62
YBa <sub>2</sub> Cu <sub>3</sub> O <sub>7</sub>	93	138,39	120
HgBa <sub>2</sub> Ca <sub>2</sub> Cu <sub>3</sub> O <sub>10</sub>	135	200,88	190
Rb <sub>3</sub> C <sub>60</sub>	29,5	43,89	44
K <sub>3</sub> C <sub>60</sub>	19,5	29,02	30
MgB <sub>2</sub> ( $\xi = 51\text{nm}$ )	39	58,03	39
PbMo <sub>6</sub> S	15	22,32	60
ZrV <sub>2</sub>	8,5	12,65	16,5
NbN	16	23,82	22

with Bohr magneton for both particles ( two electrons or electron and positron).

So for similar particles in Cooper pair, for example, electrons we have:

$$B_{c2} = \frac{2A}{\mu_B}$$

Let's remember, that  $A = \frac{\Delta}{4} = \frac{\mu_B kT_c}{2}$ . So it turns out to

$B_{c2} = \frac{kT_c}{\mu_B}$ , which is similar with Klogston's estimation.

## Conclusion

Thus, the received estimate for superconductors' second critical field sufficiently consistent with experimental data for compounds from the table: superconducting alloys, metallic compounds, fullerenes, nitride and Laves phase. The estimation is not good in accuracy of calculations for Chevrel phase and MgB<sub>2</sub>.

According to the research we have an analogy between condensed, uncondensed Cooper pair and model of Zeeman's splitting of energy levels of the pair.
