## **Radiative Neutrino Mass with GeV Scale Majorana Dark Matter in Scotogenic Model**

Avnish Kirtiman Ghosh 26.10.2022

# MOTIVATIONS

- The Scotogenic Model is among the simplest extension of the SM to generate neutrino mass and solve the DM problem.
- Neutrino mass generates radiatively with TeV Scale exotics and they are collider testable.
- density and LFV process observation bounds.
- neutrino mass, LFVs and DM Relic density bounds simultaneously.
- For this purpose, we utilized a parameterization which reduces the effective

• Yukawa couplings are very important here, and are constrained from the DM relic

• We have searched for the maximum possible Yukawa couplings while satisfying the

parameters to only three and make our framework very predictive at the colliders.

# Noce $L = L_{N_i} + L_H + L_{\Phi} + L_{int}$ $L_{N_i} = \frac{i}{2} \overline{N_i} \partial N_i + \frac{1}{2} (M_{N_i} \overline{N_i^c} N_i + h \cdot c)$

 $L_H = (D_\mu H)^{\dagger} (D^\mu H) - \mu^2 H^{\dagger} H + \lambda (H^{\dagger} H)^2$  $L_{\Phi} = (D_{\mu}\Phi)^{\dagger}(D^{\mu}\Phi) - \mu^{2}_{\phi}\Phi^{\dagger}\Phi - \lambda_{\phi}(\Phi^{\dagger}\Phi)^{2}$  $L_{int} = \left[-\lambda_1 (H^{\dagger}H)(\Phi^{\dagger}\Phi) - \lambda_2 \left| H^{\dagger}\Phi \right|^2 - \frac{\lambda}{2} \left[(H^{\dagger}\Phi)^2 + h \cdot c \right]\right]$  $-(Y^{\alpha i}\overline{L}_{\alpha I}\tilde{\Phi}N_{i}+h.c.)]$ 

We the VEVs:  $\langle H \rangle = \frac{v}{\sqrt{2}}$ , Where v = 246 GeV  $m_{\phi_s}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi_p}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \mu_{\phi}^2 + \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda_2 + \tilde{\lambda}\right) v^2 \qquad m_{\phi}^2 = \frac{1}{2} \left(\lambda_1 + \lambda$ 

$$H = \begin{pmatrix} h^+ \\ \frac{v+h+i\eta}{\sqrt{2}} \end{pmatrix}, \quad \Phi = \begin{pmatrix} \phi^+ \\ \frac{\phi_s+i\phi_q}{\sqrt{2}} \end{pmatrix}$$

and 
$$<\Phi>=0$$

$$\frac{1}{2} \left( \lambda_1 + \lambda_2 - \tilde{\lambda} \right) v^2$$

$$m_{\phi^{\pm}}^{2} = \mu_{\phi}^{2} + \frac{1}{2}\lambda_{1}v^{2}$$

# Neutrino Mass Generation

The neutrino oscillation experiments performed over the last few decades provided imperative evidences for neutrino flavour oscillation, and hence non-zero neutrino masses and mixings. **Z2** symmetry prevents any Tree Level contribution in  $\nu$ -mass

$$[M_{\nu}]^{\alpha\beta} = \sum_{i} \frac{Y^{\alpha i} Y^{\beta i} M_{N_{i}}}{32\pi^{2}} \left[ \frac{m_{\phi_{s}}^{2}}{m_{\phi_{s}}^{2} - M_{N_{i}}^{2}} \ln\left(\frac{m_{\phi_{s}}^{2}}{M_{N_{i}}^{2}}\right) - \frac{m_{\phi_{p}}^{2}}{m_{\phi_{p}}^{2} - M_{N_{i}}^{2}} \right]$$
For  $\tilde{\lambda} < < 1$ 

$$[M_{\nu}]^{\alpha\beta} = \frac{|\tilde{\lambda}| v^{2}}{32\pi^{2}} \sum_{i} \frac{Y^{\alpha i} Y^{\beta i} M_{N_{i}}}{\bar{m}^{2} - M_{N_{i}}^{2}} \left[ 1 - \frac{M_{N_{i}}^{2}}{\bar{m}^{2} - M_{N_{i}}^{2}} \ln\left(\frac{\bar{m}_{N_{i}}}{\bar{m}^{2} - M_{N_{i}}^{2}}\right) \right]$$

, Where  $\bar{m}^2 = \frac{(m_{\phi_s}^2 + m_{\phi_p}^2)}{2}$ 

The tininess of the neutrino mass can be achieved

**Postulation of** very small Yukawa couplings

Very massive particles in the loop

Tiny quadratic coupling  $\tilde{\lambda}$ 

What we want:

Large Yukawa Couplings with TeV Scale Exotic Particles for greater detection prospects at the Colliders

# Parameterisation

To make consistency of high energy theory to explain the low energy neutrino oscillation experimental observations, the proper parameterisation is must

We can recast neutrino mass contribution from loop as:

Diagonalization of  $M_{\nu}$  to a diagonal matrix  $\tilde{M}_{\nu}$   $\longrightarrow$   $M_{\nu} = U \tilde{M}_{\nu} U^{T}$  $\tilde{M}_{\nu} = \text{diag}(m_1, m_2, m_3)$ Where, U is PMNS matrix

$$\tilde{M}_{\nu} = \frac{|\tilde{\lambda}| v^2}{32\pi^2} U^{\dagger} Y \mathscr{M}^{-1} Y^T U^*$$

We get the Most general forms :

$$R^{T} = \frac{\sqrt{|\tilde{\lambda}| v}}{4\sqrt{2\pi}} \sqrt{\tilde{M}_{\nu}}^{-1} U^{\dagger} Y \sqrt{\mathcal{M}^{-1}}$$

$$M_{\nu} \simeq \frac{|\tilde{\lambda}| v^{2}}{32\pi^{2}} \left(Y \mathscr{M}^{-1} Y^{T}\right)$$
$$[\mathscr{M}^{-1}]^{ij} = \delta^{ij} \frac{M_{N_{i}}}{\bar{m}^{2} - M_{N_{i}}^{2}} \left[1 - \frac{M_{N_{i}}^{2}}{\bar{m}^{2} - M_{N_{i}}^{2}} \ln\left(\frac{\bar{m}^{2}}{M_{N_{i}}^{2}}\right)\right]$$

 $I_{3\times 3} = R^T R$ 

*R* is an orthogonal  $n \times 3$  matrix and n is decided with no .of Right handed neutrinos

# Lepton Flavour Violation and Conversion Rate

LFV processes in the charged lepton sector arise at one loop level by exchange of new particles  $\phi^{\pm}$  and  $N_i$  's due to  $Z_2$  symmetry.

The Conversion of  $(\mu - e)$  in nuclei Also take place through one loop processes

#### JHEP 01 (2014) 160

Being unable to detect some signal at the experiments, severe experimental bounds put over theoretical predictions

Among these experimental bounds, BR( $\mu \rightarrow e\gamma$ ) and CR(µ -e, Au) put the most severe limits on the parameter space of the model  $(4.2 \times 10^{-13} \text{ and } 7.0 \times 10^{-13})$ 

# **Dark Matter Searches**

Dark matter is one of the most pressing evidence of inadequacy of the SM

Space observation data sets bound over dark matter relic density 

> Scalar Dark Matter  $\phi_s$  and  $\phi_p$

We are considering the Lightest  $N_i$  as the dark matter and it production through Freeze-out Mechanism

We need large Yukawa coupling to satisfy DM relic density with (co)-annihilation involving the heavy fermions.

Large Yukawa couplings (in general) lead to large LFV processes.

### **Annihilation diagrams**

# Issues and Remedy

#### Can we have dark matter relic density satisfaction along with the LFV bounds in $\nu$ -mass model?

The most severe problem is suppressing the LFV. LFV BR is mainly controlled by off-diagonal parts of the multiplication of Yukawa couplings The LFV bounds can be minimised by

$$\begin{split} & \operatorname{BR}(l_{\alpha} \to l_{\beta}\gamma) = \frac{3\alpha_{em}\nu^{4}}{32\pi m_{\phi^{\pm}}^{4}} \left| \begin{array}{c} \sum_{i=1}^{3} Y^{\alpha i}Y^{\beta i}{}^{*}F_{2}\left(\frac{M_{N_{i}}^{2}}{m_{\phi^{\pm}}^{2}}\right) \right| & \text{and} \\ & \text{Taking} & \sqrt{F_{2}}\sqrt{\mathscr{M}}R^{*}\sqrt{\tilde{M}_{\nu}} = X & \text{and} \\ & \bullet & \operatorname{IFF}: & F_{21}\mathscr{M}_{11}\tilde{M}_{\nu 11} = F_{22}\mathscr{M}_{22}\tilde{M}_{\nu 22} = X \end{split}$$

The best outcome of this parameterisation is this:

The lightest  $N_i$ 's mass:  $M_{N_i}$ 

The lightest physical neutrino mass  $m_i$ 

 $Y = \frac{4\sqrt{2\pi}}{\sqrt{|\tilde{\lambda}| v}} U \sqrt{\tilde{M}_{v}} R^{T} \sqrt{\mathcal{M}}$ 

 $U\left(\sqrt{\tilde{M}_{\nu}}R^{T}\sqrt{\mathcal{M}}\sqrt{F_{2}}\right)\left(\sqrt{F_{2}}\sqrt{\mathcal{M}}R^{*}\sqrt{\tilde{M}_{\nu}}\right)U^{\dagger}=I$ 

In the special choice  $X = \sqrt{CI}$ 

 $= F_{23} \mathscr{M}_{33} \widetilde{M}_{\nu_{33}} = C$ 

, Where C is some constant

We have only 3 parameters for whole physical phenomenology

The value of  $\lambda$ 

# **Exotic Parameter Space**

#### The region below red dashed line is allowed by DM relic density

#### The points on the red line satisfy all the bounds ranging from Dark relic density, CR( $\mu - e, Au$ ) and perturbativity

For these parameter scans in Normal Hierarchy, We have fixed  $M_{N_1}$  fixed and masses of  $M_{N_2}$ ,  $M_{N_2}$  calculated

> The parameters for these scans:  $\mu_{\phi} = 1$  TeV  $\lambda_1 = 0.004$  $\lambda_2 = 0.005$

The constrained parameter space in  $(M_{N_1} - \tilde{\lambda})$  plane is depicted as

Red dashed line points are the points satisfying the LFV as well as DM relic Density constraints simultaneously.

Here, We have considered only Normal Hierarchy, Because Inverted Hierarchy have not many points

With increasing the lightest neutrino mass, the value of required  $\tilde{\lambda}$  also lncreases.

The parameters for these scans:

### **Bench Mark Points**

### **Collider Signature Search**

#### <u>Signal 1 : Mono-Photon + Missing Energy</u>

At collider ,  $N_1$  being dark matter goes into missing transverse energy. But we can have mono-photon from ISR as a signature at the colliders. **Normal Hierarchy**  $N_1N_1, N_1N_2, N_2N_2$ In signal we take :

The SM background for this signal :  $2\nu$ +photon.

We have plotted the required luminosity for 5- $\sigma$ detection For two different lightest neutrino mass values for varying Dark matter particle mass

 $\lambda$  changed in order to keep **DM relic density and LFV** satisfied

### <u>Signal 2 : Opposite Sign Di-Leptons + Missing Energy</u>

- At collider ,  $N_3$  produces with  $N_1$ .
- Heavier  $N_3$  Decays into leptons and  $N_{1,2}$ .
- **Provides** Opposite Sign di-Leptons +  $E_T$  as signature.

**SM Background :**  $l^{\pm}l^{\mp}\nu\bar{\nu}$ , Leptonic decay of  $(t\bar{t} + \tau\bar{\tau})$

### Thanks for your time and valuable attention

# **Node Constraints**

**Theoretical constraints :** 

Vacuum stability conditions :

 $\lambda, \lambda_{\phi} > 0, \ \lambda_{1}, \lambda_{1} + \lambda_{2} - |\tilde{\lambda}| > - 2\sqrt{\lambda\lambda_{\phi}}$  $\lambda, \lambda_{\phi} < 4\pi, \ |\lambda_1 + \lambda_2| < 4\pi, \ |\lambda_1 + \lambda_2 \mp \frac{\tilde{\lambda}}{2}| < 4\pi$ 

**Perturbativity :** 

**Experimental constraints :** 

Gauge boson decay widths :

 $2m_{\phi^{\pm}} > m_Z, \ m_{\phi^{\pm}} + m_{\phi_s} > m_W$ 

LEP direct searches of Charginos and Neutralinos :

 $m_{\phi_s} + m_{\phi_p} > m_Z, \ m_{\phi^{\pm}} + m_{\phi_p} > m_W,$  $m_{\phi^{\pm}} > 113.5 \text{ GeV}, \max[m_{\phi_s}, m_{\phi_p}] > 100 \text{ GeV}$ 

# **Mass Variations :**

To See how the masses of other right handed neutrino varies, we have plotted them with varying the lightest neutrino mass

In the Normal Hierarchy,  $M_{N_2}$  is almost degenerate with  $M_{N_1}$ 

The value of  $M_{N_3}$  reduces with the increasing the lightest neutrino mass

 $\tilde{\lambda} = 1 \times 10^{-9}$ 

In the Inverted Hierarchy,  $M_{N_2}$  is almost degenerate with  $M_{N_3}$ The value of  $M_{N_1}$  reduces with the increasing the lightest neutrino mass

• The tiny neutrino mass can be explained by d=5 Weinberg's operator

#### Loop realisations of Weinberg operator

# Motivation

### Weinberg Operator

$$\frac{LLHH}{\Lambda}, \ m_{\nu} = \frac{v^2}{\Lambda}$$

#### Gener<sup>d</sup> Weinberg Operator

$$\frac{LLHH\left(H^{\dagger}H\right)}{\Lambda^{2n+1}}, \ m_{\nu} \sim \epsilon \left(\frac{1}{16\pi^{2}}\right)^{n} \left(\frac{\nu}{\Lambda^{2n+1}}\right)^{n} \left(\frac$$

Models without additional global Symmetry: Interesting collider Signatures

Models with additional global symmetries: Candidates for dark matter
