Femtoscscopy QA, request 31

Konstantin Mikhaylov (JINR, NRC "Kurchatov Institute")

Grigory Nigmatkulov (JINR, National Research Nuclear University MEPhI)

Femtoscscopy

Parametrizations used:

1D CF: $C(q_{inv}) = 1 + \lambda e^{-R^2 q_{inv}^2}$

R – Gaussian radius in PRF,

λ – correlation strength parameter

Correlation femtoscopy :

Measurement of space-time characteristics \mathbf{R} , $\mathbf{c\tau}$ of particle production using particle correlations due to the effects of quantum statistics (QS) and final state interactions (FSI)

Two-particle correlation function:

theory:
$$C(q) = \frac{N_2(p_1, p_2)}{N_1(p_1) \cdot N_2(p_1)}, C(\infty) = 1$$

experiment:
$$C(q) = \frac{S(q)}{B(q)}, q = p_1 - p_2$$

$S(q)$ – distribution of pair momentum difference from same event

$B(q)$ – reference distribution built by mixing different events

Request 31

- Request 31: Femtoscopy-purpose, 50 M UrQMD BiBi@9.2 with freeze-out
- UrQMD + **Geant-3** based femtoscopy-purpose simulation with **freeze-out coordinates** project for minbias ($b = 0-16$ fm) Bi (83/209) +Bi (83/209) collisions at 9.2 GeV, detector configuration for femtoscopy only
- runMC.C
- runReco.C
- 100K events for QA
- Input root DST files at /eos/nica/mpd/users/gnigmat/mcDst/bibi_ecm_9.2 (53760 files) → file13 standard file (like file14) with additionally the freeze-out coordinates for all particles

Request 25 (for comparison)

- Request 25: General-purpose, 50M UrQMD BiBi@9.2
- UrQMD + **Geant-4** based general-purpose simulation project for minbias ($b = 0-16$ fm) Bi (83/209) +Bi (83/209) collisions at 9.2 GeV, full detector configuration.
- runMC.C
- runReco.C
- 100K events for QA

Femtoscscopy QA test: correlation function

- **Reconstructed** correlation function(CF) with mixing procedure:

$$CF_{\text{reco}} = [dN_{\text{real}}/dq_{\text{inv}} * W(r,p)] / [dN_{\text{mixed}}/dq_{\text{inv}}]$$

- Correlation function with **pure QS** weight:

$$CF_{\text{pure}} = [dN_{\text{real}}/dq_{\text{inv}} * W(r,p)] / [dN_{\text{real}}/dq_{\text{inv}}], \text{ where } W \text{ is QS weight}$$

$W=1+\cos(\Delta x \Delta p)$, where x distribution is Gaussian with width 5 fm

- The main test is to compare **reco** and **pure QS** CFs
They should be very close
- Other QA tests are also important

Pion selection for CF

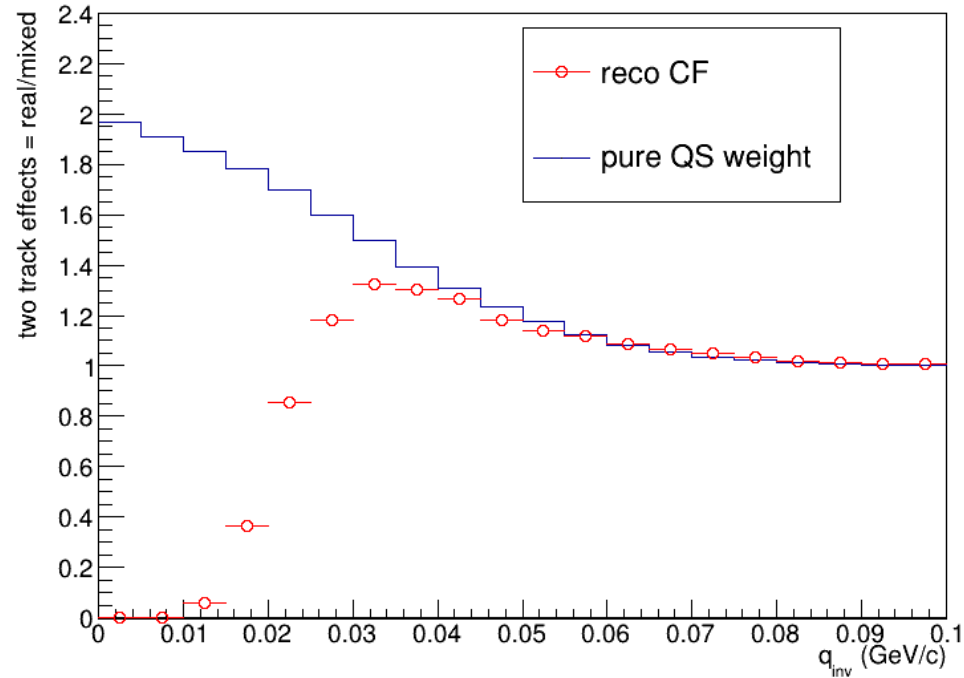

- MC track PDG code is equal 211
- Primary tracks
- Nhits ≥ 20
- $0.2 < p_T < 2$ GeV/c
- $|\eta| \leq 1$
- The same selection conditions are for the whole study
- DST files are located in:

`req31:/eos/nica/mpd/sim/data/qa/req31g4/dst/`

`req25:/eos/nica/mpd/sim/data/exp/dst-BiBi-09.2GeV-mp07-22-500ev-req25/BiBi/09.2GeV-mb/urqmd/BiBi-09.2GeV-mp07-22-500ev-req25/`

Reconstructed CF request 31

Request 31: UrQMD all $0.2 < k_T < 2.0$ GeV/c

- Unexpected broad dip for request 31: significant two-track effects or something else?

Reconstructed CF request 31 vs 25

Request 31: UrQMD all $0.2 < k_T < 2.0$ GeV/c

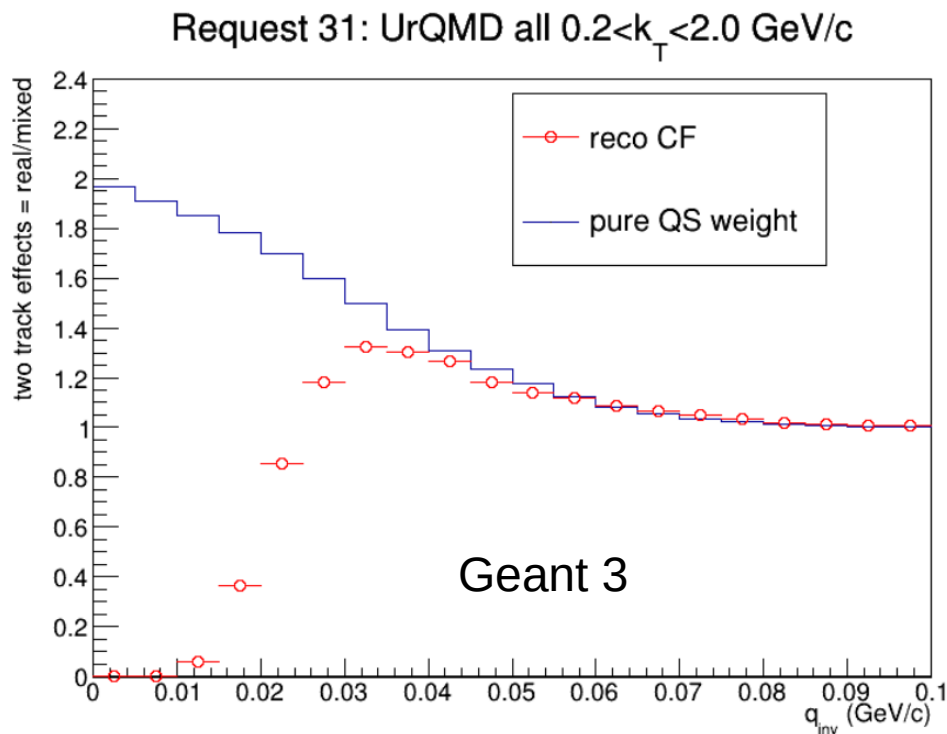

Request 25: UrQMD all $0.2 < k_T < 2.0$ GeV/c

- No dip at small q for request 25
- The difference is version of GEANT?

Reconstructed CF request 31: geant3 and geant4

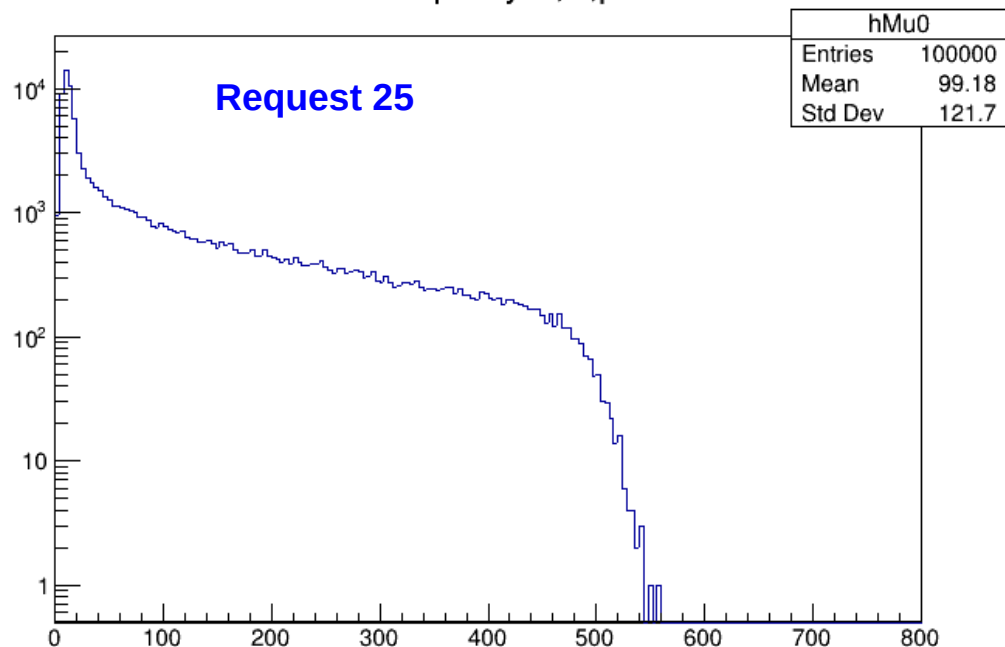

- There is no difference between Geant 3 and Geant 4
- Both CFs are very close to each other and the broad dip is for both...

Multiplicity: π, K, p selected by PDG

Multiplicity π, K, p

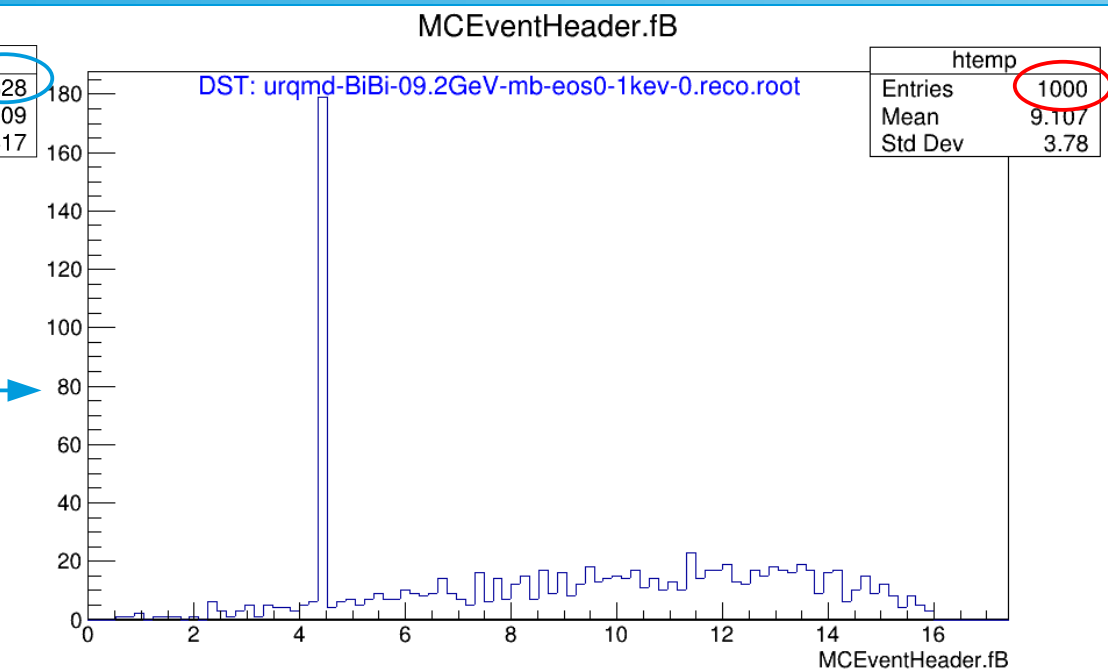

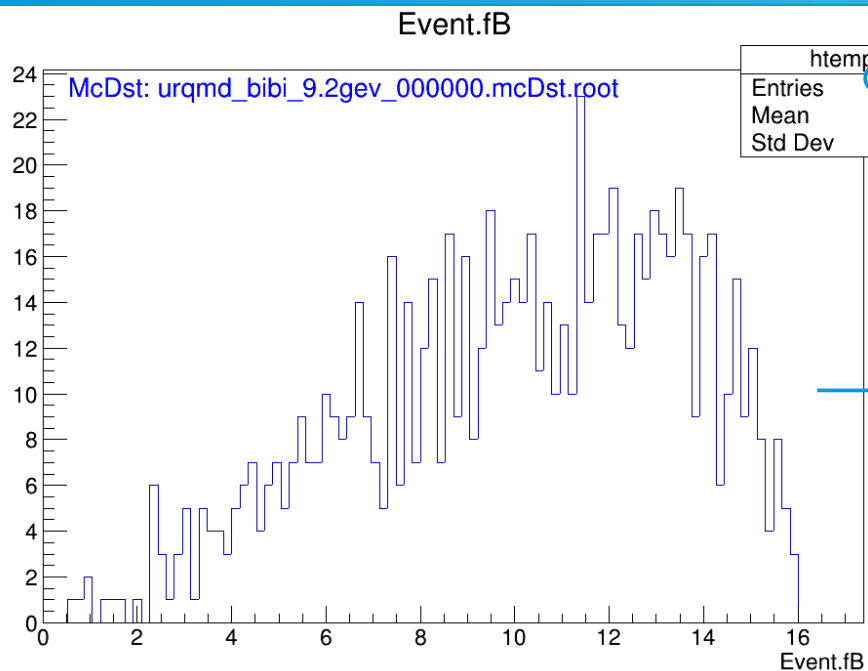

Multiplicity π, K, p

- Multiplicity plot for request 31 is not a smooth function – deviations are outside statistical fluctuations

Impact parameter: one McDst file → one DST file

- Input file has 828 events
- b distribution looks like min. bias
- DST file has 1000 events
- Outlier with 172 events with the same impact
- Outliers are in the last 172 events of the file

Multiplicity: “good” and artificial events (10 files)

Multiplicity π, K, p

Multiplicity π, K, p

- “Good” events
 - For some reason, an incident occurred during the production of input files. The number of events is not equal 1000. We didn't know about it
- Reconstruction files contain artificial events with similar characteristics. Particles have close momenta, since the events are initially the same
- Artificial events at the end of file

Correlation function: “good” and artificial events

cf_mixed: $0.2 < k_T < 2.0$ GeV/c

- “Good” events
- CF looks reasonable

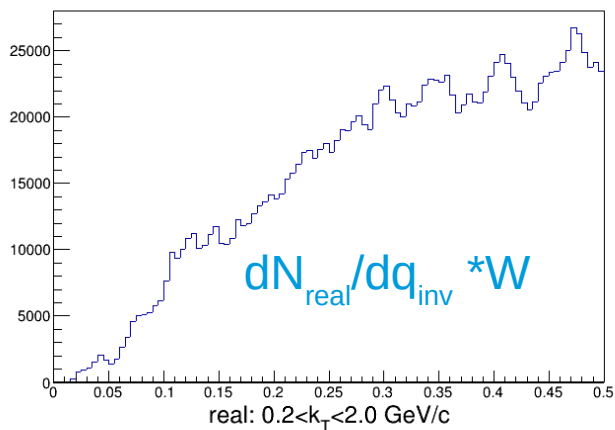

cf_mixed: $0.2 < k_T < 2.0$ GeV/c

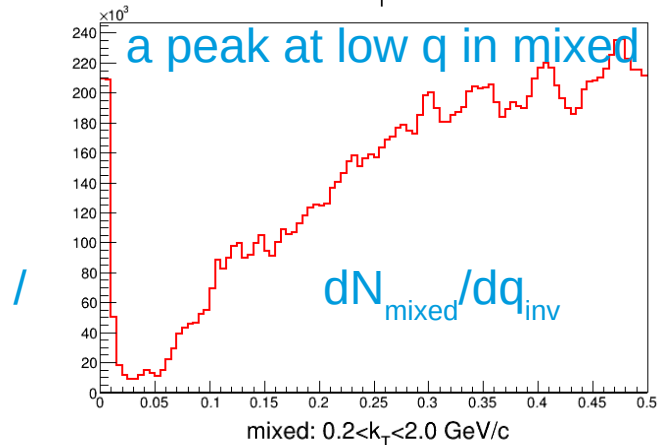

- Artificial events with close multiplicity groups
- CF is completely destroyed

Correlation function: artificial and “good” events

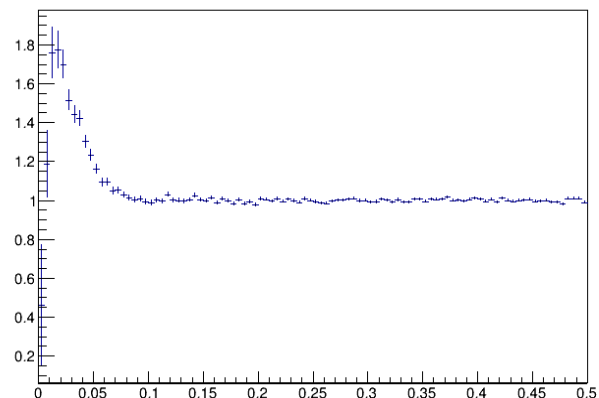

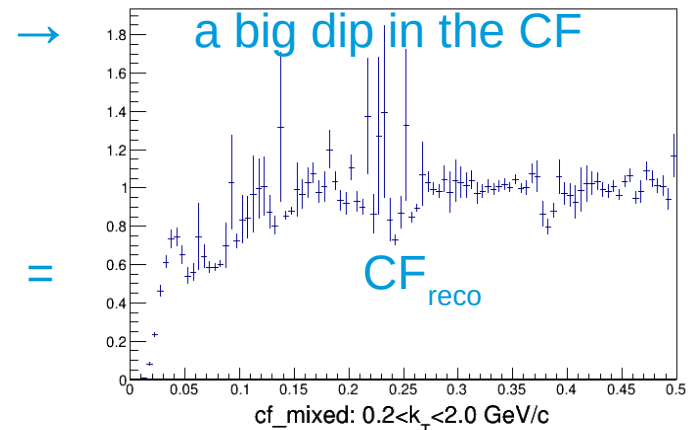

real: $0.2 < k_T < 2.0$ GeV/c

mixed: $0.2 < k_T < 2.0$ GeV/c

cf_mixed: $0.2 < k_T < 2.0$ GeV/c

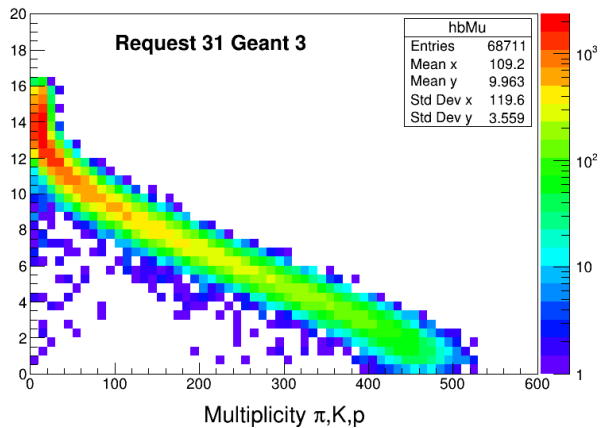

CF:request 25 and “good” events from request 31

- There is no any cuts on two-track effects yet
- Regardless of it, the reconstructed CF looks pretty good
- There is a slight difference between the CFs from request 25 and 31 for some reason
- The problem with the big dip at low q in the CF for request 31 is gone
- CFs for both G3 and G4 look pretty similar

Comparison of multiplicity for 31 and 25 requests

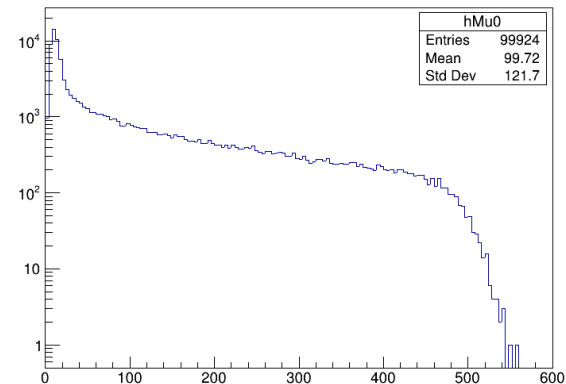

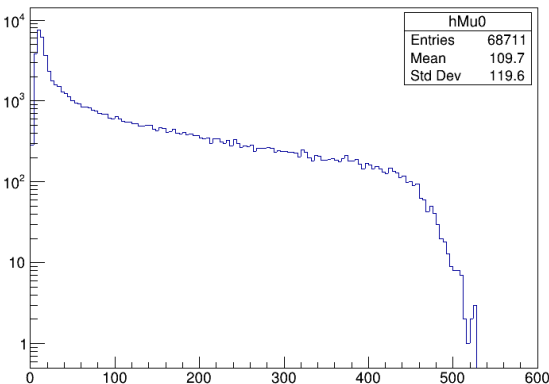

b vs multiplicity π, K, p

b vs multiplicity π, K, p

b vs multiplicity π, K, p

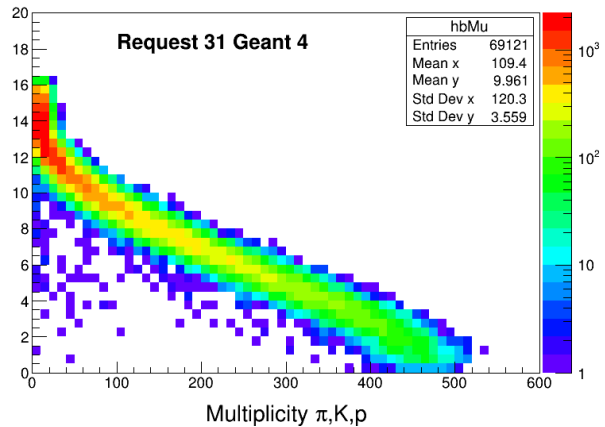

Multiplicity: π, K, p selected by PDG

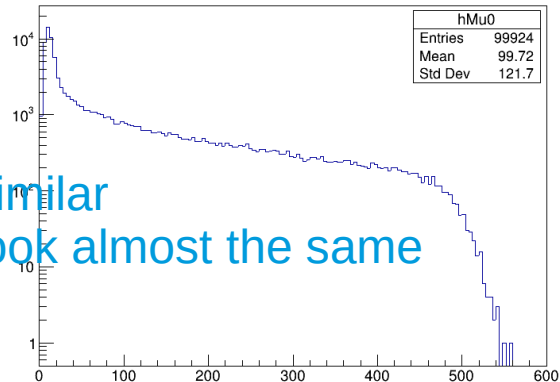

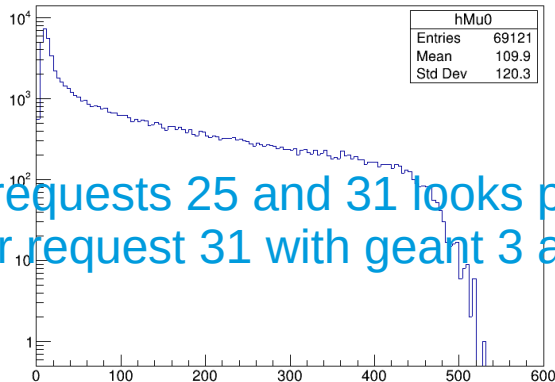

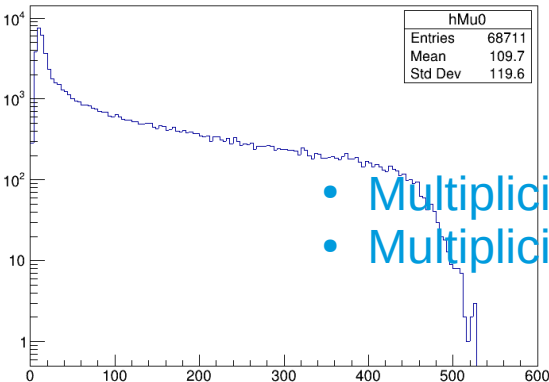

b vs multiplicity π, K, p

b vs multiplicity π, K, p

b vs multiplicity π, K, p

- Multiplicity for requests 25 and 31 looks pretty similar
- Multiplicities for request 31 with geant 3 and 4 look almost the same

Conclusions and outlooks

- There was a big problem with close track reconstruction for request 31;
- The reason: number of events are not exactly 1000 in the initial McDst input file;
- This circumstance led to artificial events that completely spoiled the correlation function;
- Solution:
 - Set nEvents in runMC.C to be equal to those in the file McDst;
 - generate files with the correct number of events to do new QA tests.

Thank you for your attention !
