

Status of the Online Processing System for the BM@N experiment

I. Romanov, K. Gertsenberger

Laboratory of High Energy Physics, JINR

Targets and goals

The purpose of online processing system is selective data processing (digitization of events and fast reconstruction) and monitoring of the data of the ongoing experiment.

The system must have **high performance**, since the volume of data is large enough and the processes of digitization and reconstruction take a long time.

Choice of **solutions** for implementation

Message exchange

FairMQ^{*} is a messaging library focused on building modular systems for data processing in high energy physics experiments.

It represents an abstraction over various messaging technologies such as ZeroMQ, Nanomsg, etc.

Deployment

DDS^{*} (Dynamic Deployment System) is a set of tools that facilitates the process of system deployment.

As a Remote Manipulator System (RMS), it initially provides SSH or SLURM, but also allows you to use other methods.

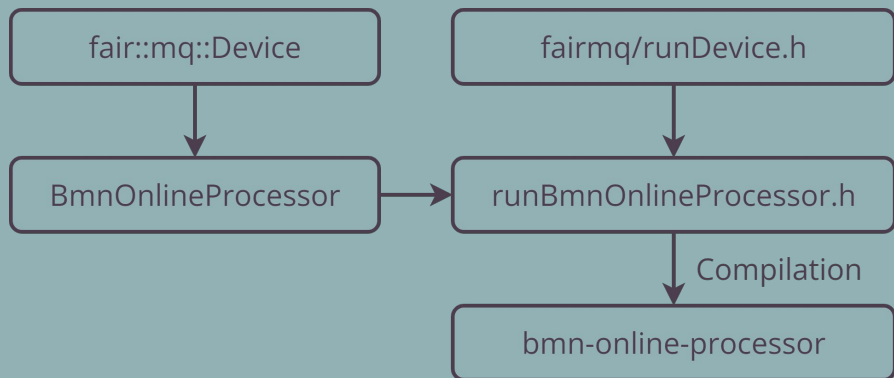

^{*} Developed by the FAIR collaboration at the GSI Institute, Germany.

FairMQ Device

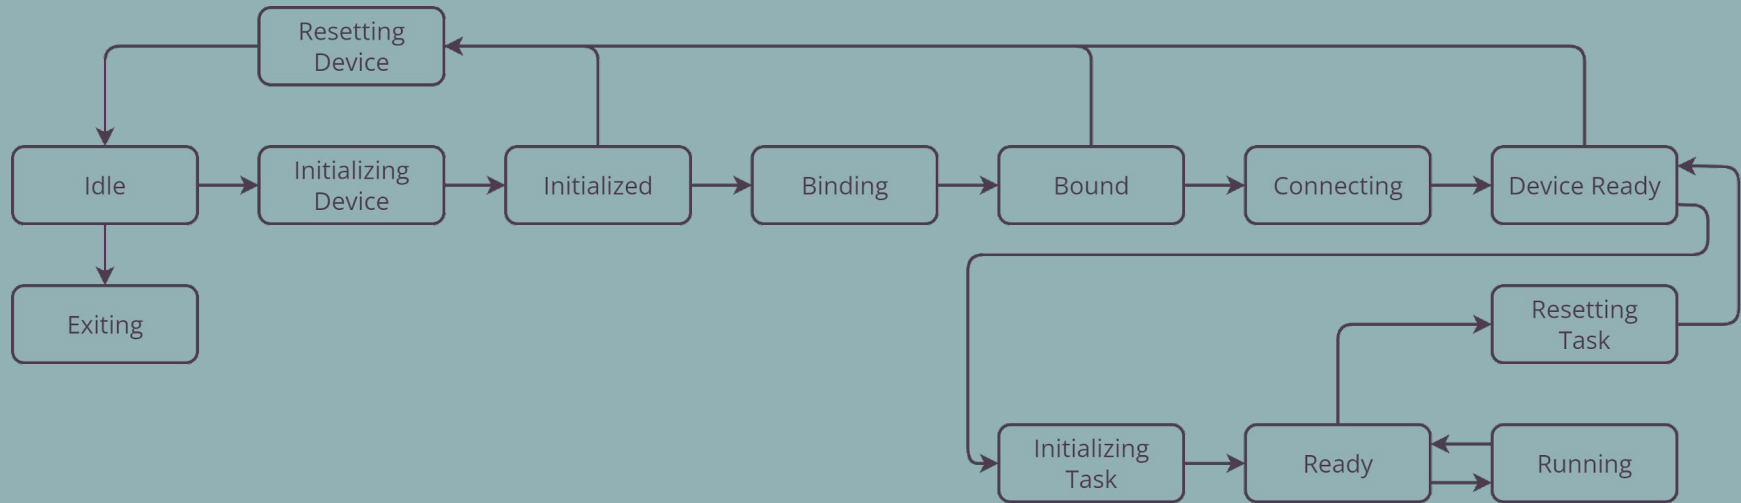

The FairMQ Device is an **executable** file.

To create a FairMQ Device, you need to:

1. Implement the **fair::mq::Device** base class;
2. Create a file, include the implemented class and the special file **runDevice.h**;
3. Compile this file into an executable format.

Life cycle of FairMQ Device

Comparison of reconstruction processes

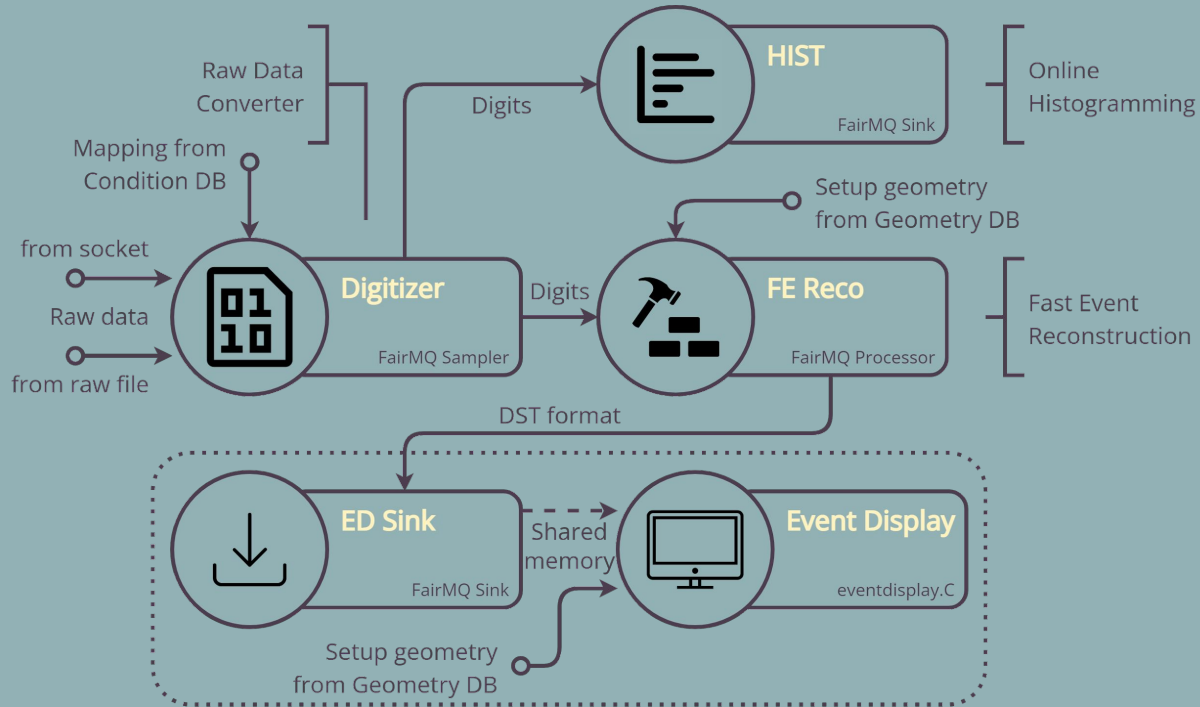

run_reco_bmn.C

FairRunAna is used to store and manage the list of tasks (initialization, execution, completion).

FairMQ Device

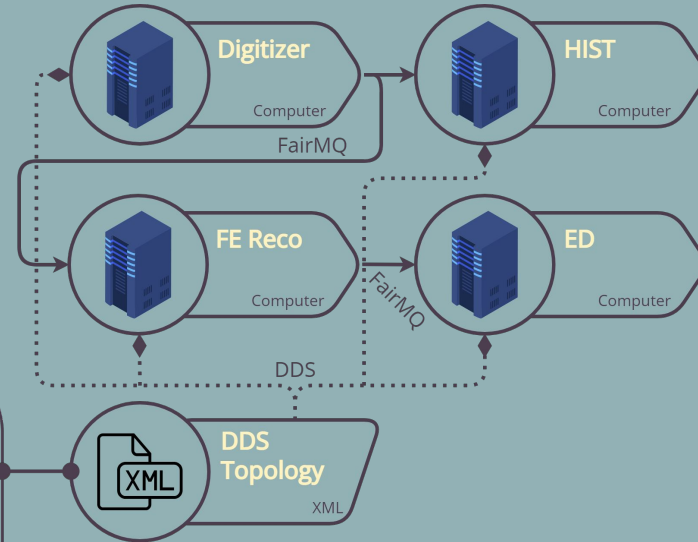

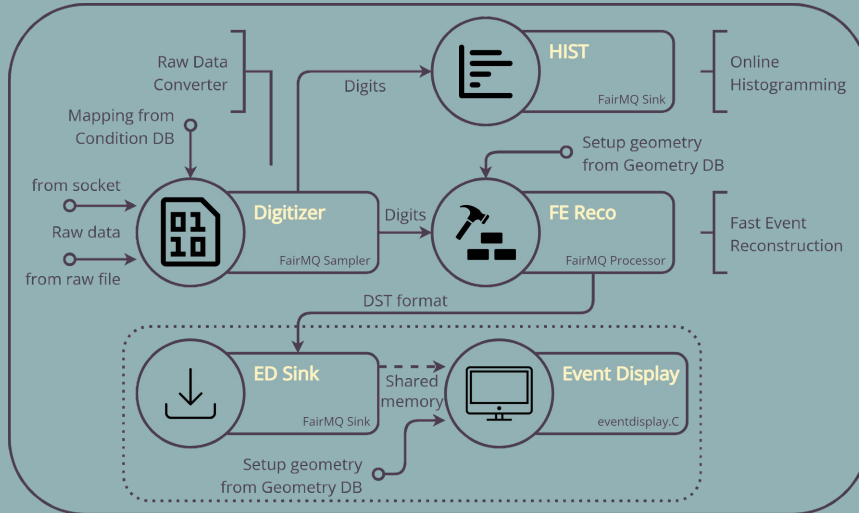

Tasks are stored in a special array. They are managed through a sequential call to the methods `InitTask`, `Exec` and `FinishTask` when the Device is in the `Running` state.

Diagram of the online processing system

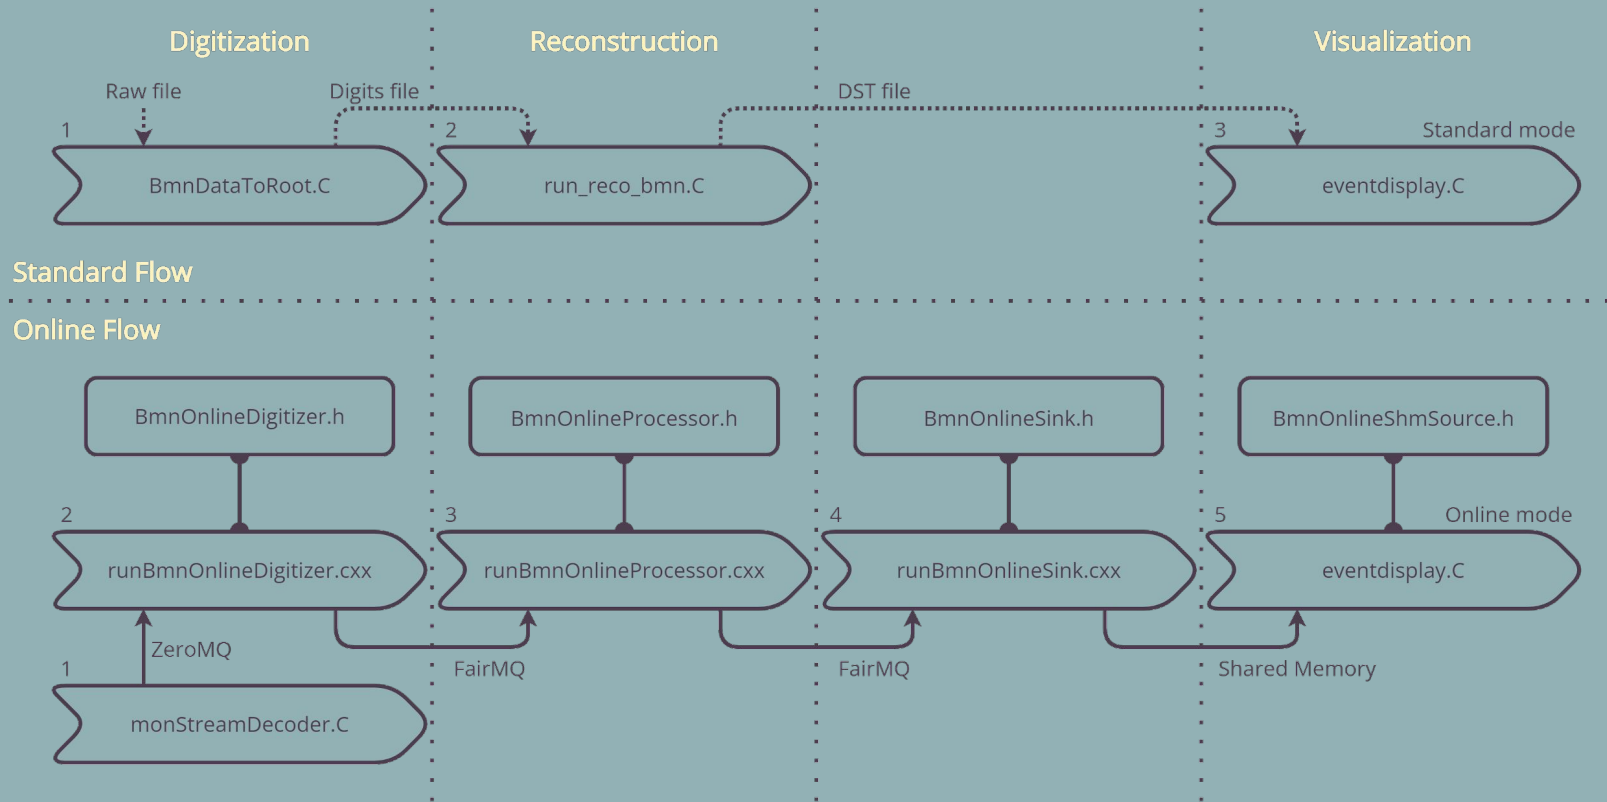

System deployment diagram

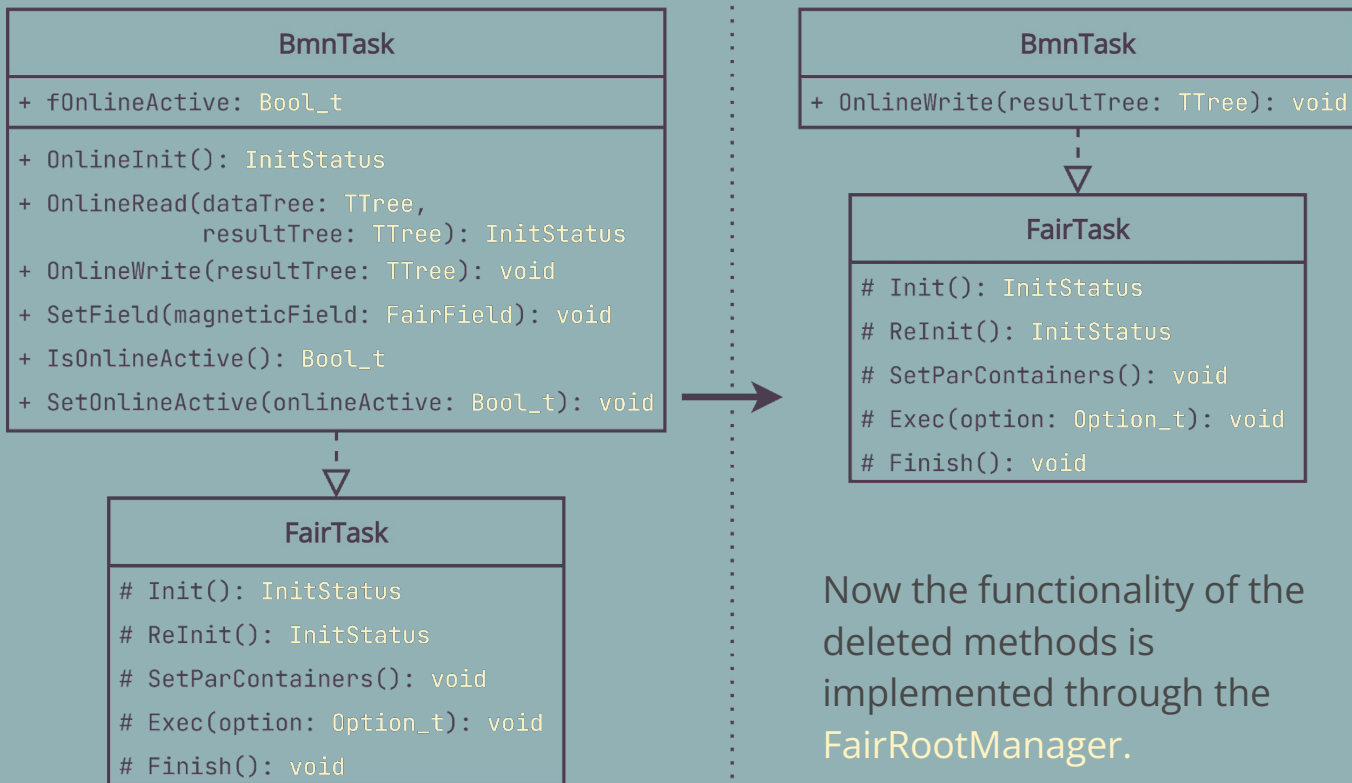

The rules by which deployment takes place is called a **topology** (it is an XML file).

Implemented solution

Updates

Now the functionality of the deleted methods is implemented through the `FairRootManager`.

Future plans

- Perform integration with the online configuration system.

Conclusion

- Integration with the monStreamDecoder.C macro was performed using the developed BmnOnlineDigitizer;
- Implemented a new approach using FairRootManager.

Thank you for your attention!
