CONTENT

- Motivation :
SPD NICA experiment at the first stage
- Dibaryons, multiquark configuration in interaction of hadrons,
Color transparency, constituent counting rules
- Data on A_{NN} for $pp \rightarrow pp$ at $\vartheta_{cm} = 90^\circ$, $\sqrt{s} = 3 - 5$ GeV and theoretical models
- How to get A_{NN} $pn \rightarrow pn$ from $dd \rightarrow pn\bar{p}n$?
- Conclusion

This work is supported by grant of Scientific program JINR-
Republic of Kazakhstan, JINR order № 411, 05.06.2023.

SEARCH FOR ONSET OF THE TRANSITION REGION

hadrons → q, g

“One of the outstanding issues of strong interaction physics is understanding the dynamics of the transition between hadronic to quark-gluon phases of matter”.

F. Gross, P. Klempt et al., 50 Years of QCD, e-print: 2212.11107[hep-ph];

Three remarkable phenomena:

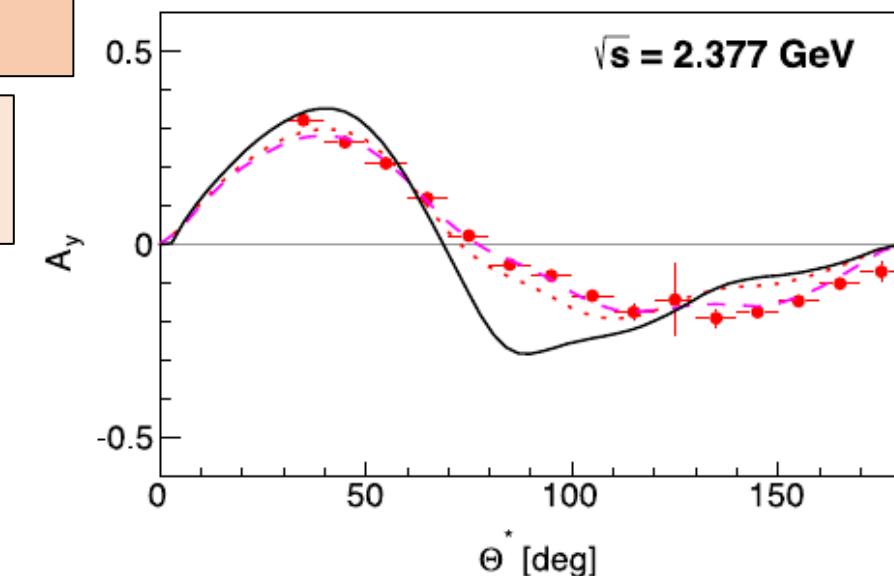

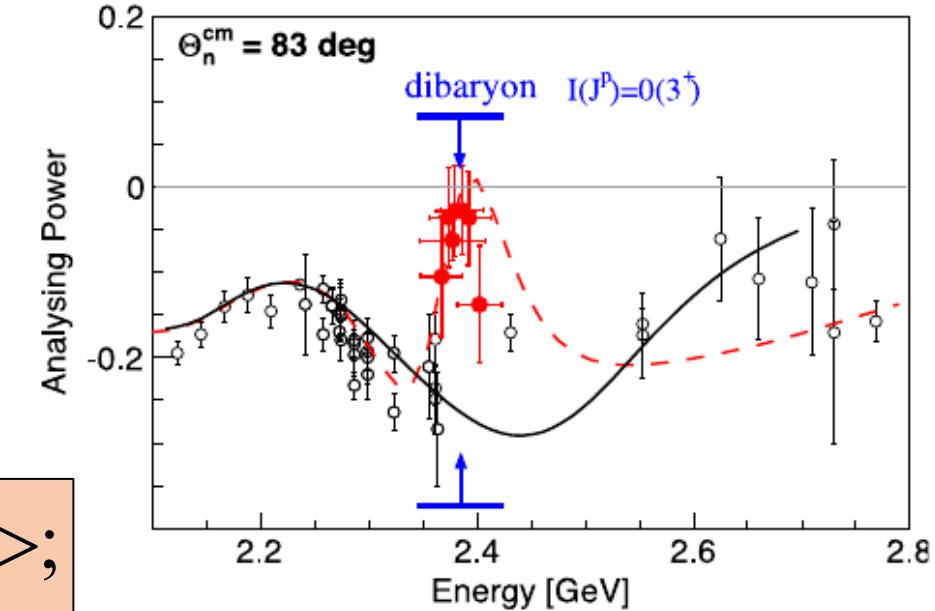

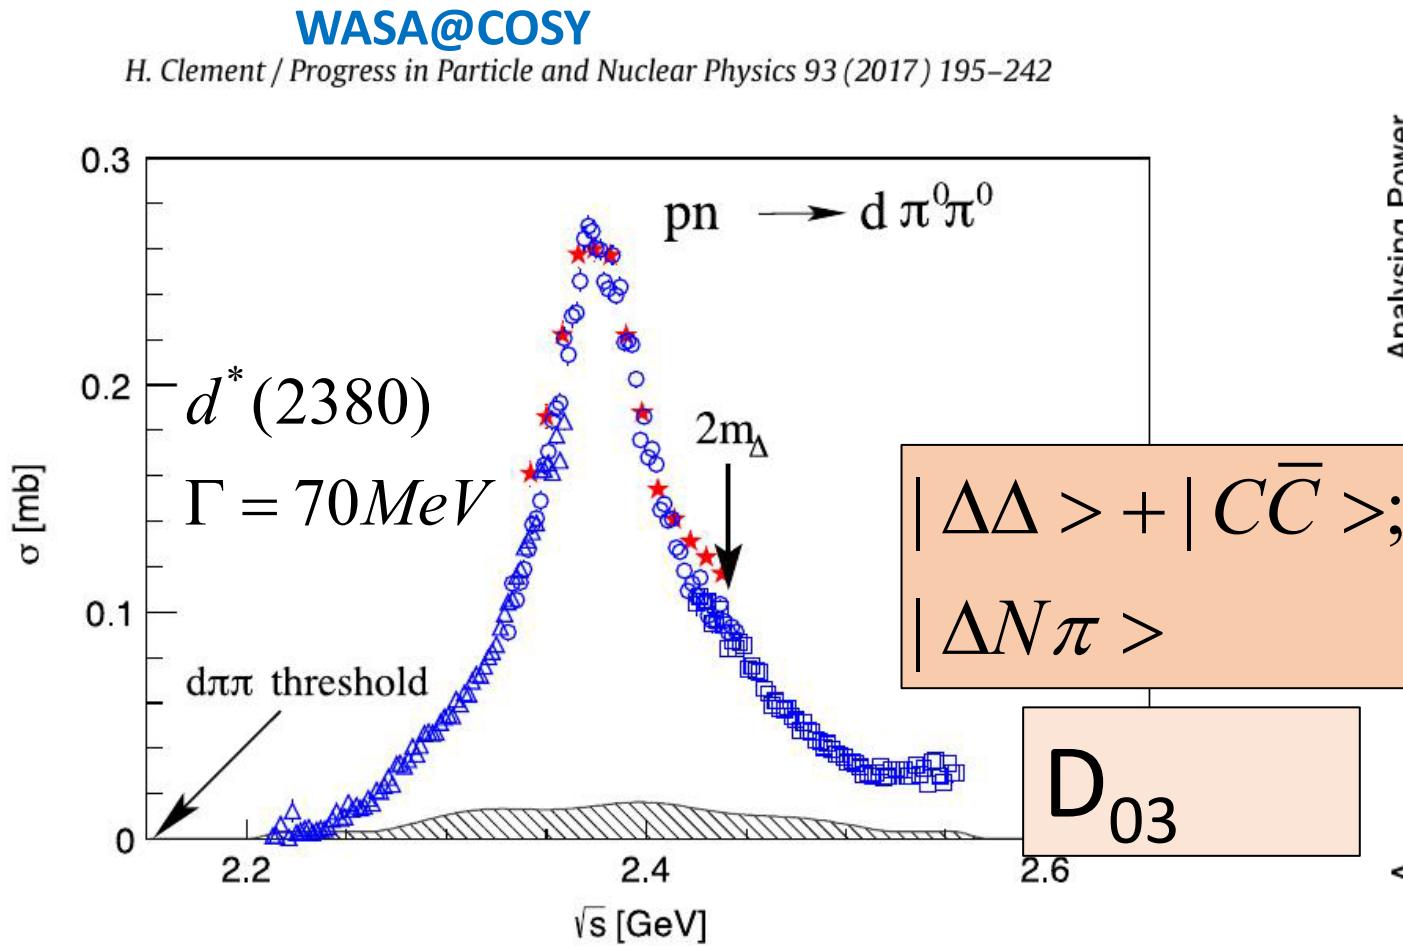

COLOR TRANSPARENCY $A(p,2p)B$

CONSTITUENT COUNTING RULES

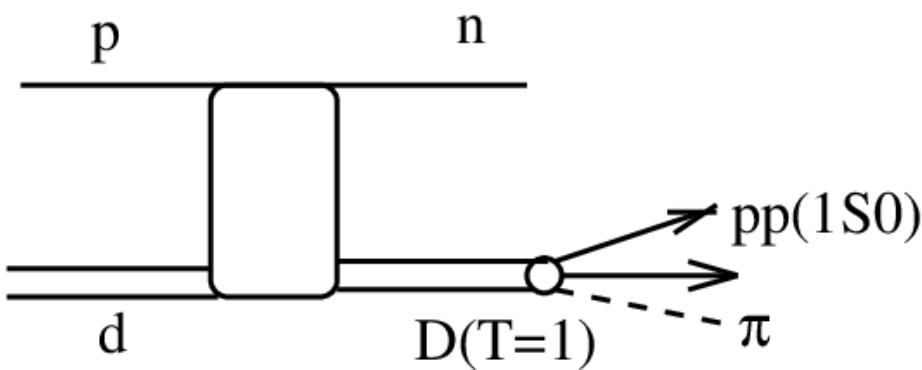

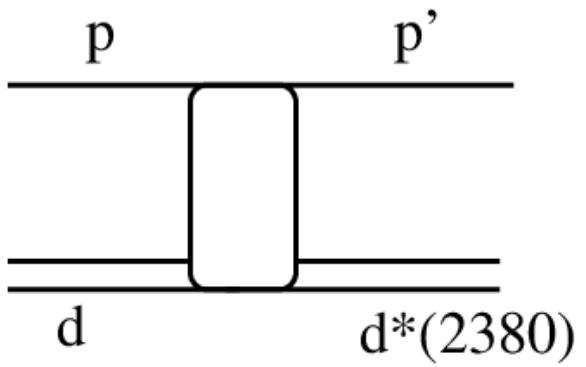

MULTIQUARK CONFIGURATIONS

**Double polarized pN-elastic scattering at 90°
includes all these features** $3GeV \leq \sqrt{s_{NN}} \leq 5.5GeV$

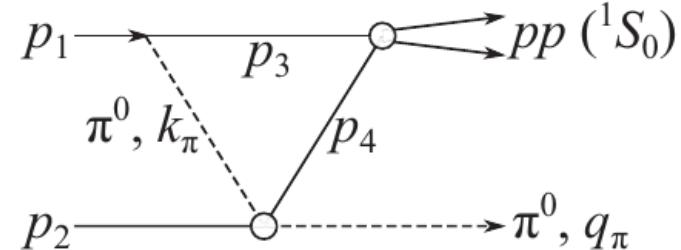

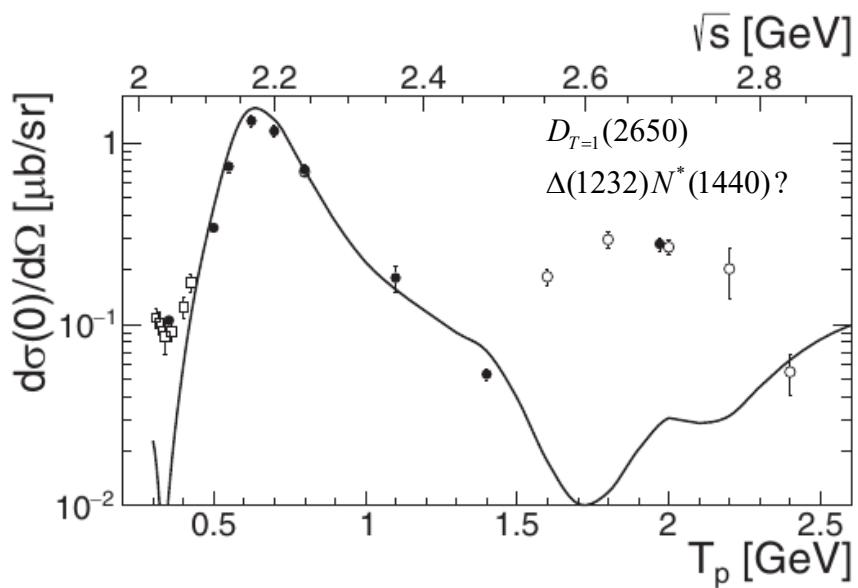

1. DIBARYON RESONANCES

DIBARYONS IN pp and pd collisions

PHYSICAL REVIEW C **107**, 015202 (2023)

PHYSICAL REVIEW C **107**, 015202 (2023)

ANKE@COSY

Resonant behavior of the $pp \rightarrow \{pp\}_s \pi^0$ reaction at the energy $\sqrt{s} = 2.65$ GeV

D. Tsirkov¹, B. Baimurzinova^{1,2,3,*}, V. Komarov¹, A. Kulikov¹, A. Kunsafina^{1,2,3}, V. Kurbatov¹, Zh. Kurmanalyiev^{1,2,3} and Yu. Uzikov^{1,4,5}

2. COLOR TRANSPARENCY

Color transparency (CT) is an unique prediction of QCD:
in the final (and/or initial) state interaction of hadrons
with nuclear medium must vanish for exclusive processes at
high momentum transfer (A. Mueller, S. Brodsky: 1982)

CT is necessary condition for factorization in exclusive hard processes

For latest review of CT see:

*D. Dutta, K. Hafidi, M. Strikman, Prog. Part. Nucl. Phys. 69 (2013) 1;
50 Years of QCD (2022), G. Sterman, P. 5.10*

CT is well established for meson production,
for baryons is questionable (see A.B. Larionov, PRC (2023) and references therein).

3. Constituent Counting Rules

Are large angle two body processes being point like probes?

Matveev, Muradyan, Tavkhelidze - self similarity

Brodsky, Farrar - pQCD

Polchinski, Strassler - AdS/CFT duality

pQCD -large angle two body reactions (-t/s=const,
 $s \rightarrow \infty$) $\pi + p \rightarrow \pi + p, p + p \rightarrow p + p, \dots$

Dimensional quark counting rules:

$$\frac{d\sigma}{dt} = f(\theta_{c.m.}) s^{(-\sum n_{q_i} - \sum n_{q_f} + 2)}$$

number of constituents

SPIN-SPIN EFFECTS IN HARD pp ELASTIC SCATTERING

PHYSICAL REVIEW D

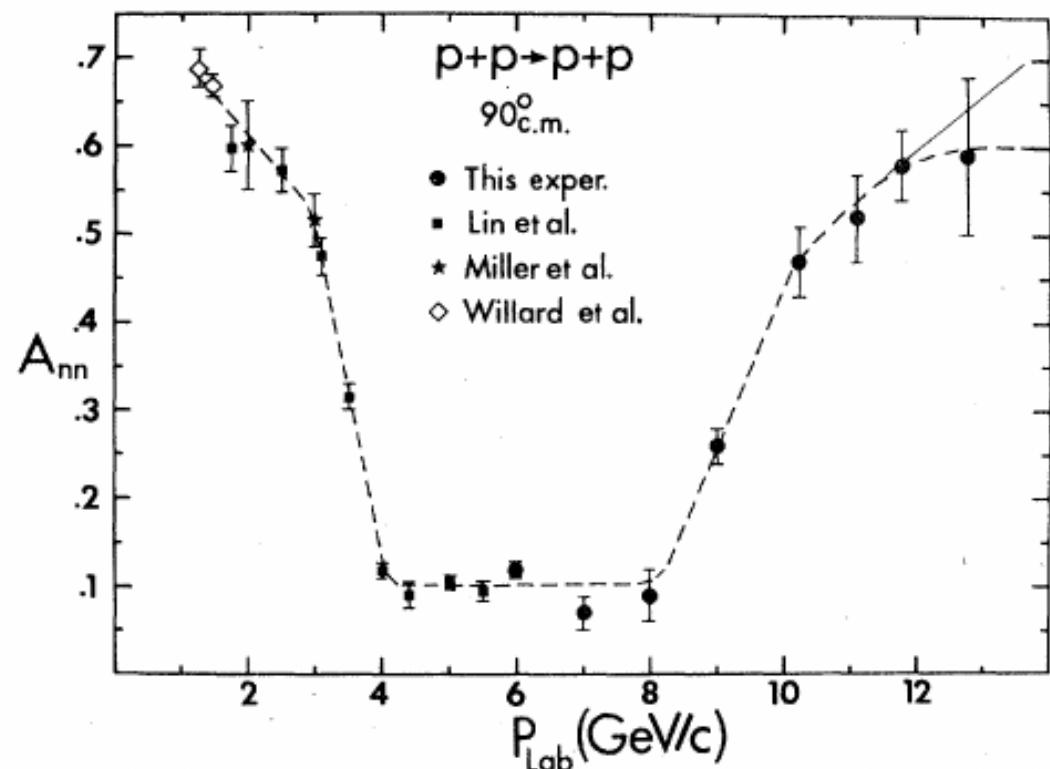

VOLUME 23, NUMBER 3

1 FEBRUARY 1981

Energy dependence of spin-spin effects in p - p elastic scattering at $90^\circ_{\text{c.m.}}$

E. A. Crosbie, L. G. Ratner, and P. F. Schultz

Argonne National Laboratory, Argonne, Illinois 60439

$$A_{NN} = \frac{d\sigma(\uparrow\uparrow) - d\sigma(\uparrow\downarrow)}{d\sigma(\uparrow\uparrow) + d\sigma(\uparrow\downarrow)}$$

$$\vartheta_{cm} = 90^\circ$$

pp(90°)-dynamics at very short distances:

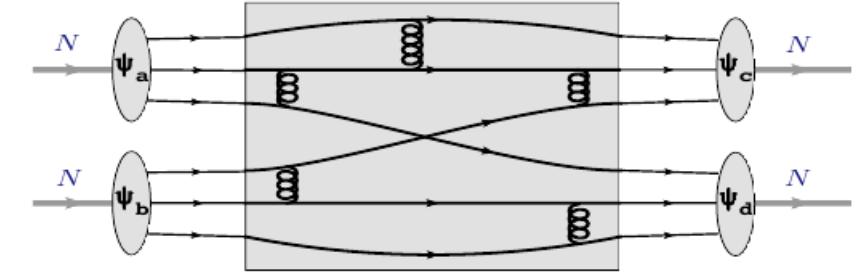

$$\sqrt{s} = 5-7 \text{GeV}, -t = 5-10 \text{GeV}^2 : r_{NN} \sim 1/\sqrt{-t} \leq 0.1 \text{fm}$$

Three aspects of QCD dynamics in pp(90°)-elastic:

- i) $d\sigma^{pp}(s, \vartheta_{cm} = 90^\circ) \sim s^{-10}$, but unexpected oscillations at $s=10-20 \text{ GeV}^2$
- ii) $A_{NN} = \frac{d\sigma(\uparrow\uparrow) - d\sigma(\uparrow\downarrow)}{d\sigma(\uparrow\uparrow) + d\sigma(\uparrow\downarrow)}$ experiment contradicts to **pQCD : $A_{NN}=1/3$**
- iii) Bump in color transparency in $A(p, 2p)$ at $4.9 \text{GeV} \leq \sqrt{s_{NN}} \leq 5.5 \text{GeV}$

S.Brodsky, de Teramond, PRL 60 (1988) 1924.

Possible explanation for all three observations:
assumes octoquarks at the thresholds $SS\bar{S}$, $CC\bar{C}$

$$\phi_1^{\text{PQCD}} = 2\phi_3^{\text{PQCD}} = -2\phi_4^{\text{PQCD}} = 4\pi CF(t)F(u)[(t-m_d^2)/(u-m_d^2) + (u \leftrightarrow t)]e^{i\delta}.$$

$$\phi_3 = M(+-,++) \quad \sigma A_{NN} = |\phi_3|^2; \sigma = 3 |\phi_3|^2; A_{NN}^{\text{pQCD}} = \frac{1}{3}$$

pQCD QIM

$$\phi_3^{\text{res}} = 12\pi \frac{\sqrt{s}}{p_{\text{c.m.}}} d_{1,1}^1(\theta_{\text{c.m.}}) \frac{(1/2)\Gamma^{pp}(s)}{M^* - E_{\text{c.m.}} - \frac{1}{2}i\Gamma},$$

Interference of pQCD term and non-perturbative resonance term allows one to explain all three above features

Octoquark resonances: $J = L = S = 1$ $uudss\bar{s}uud$ $\sqrt{s} = 3\text{GeV}$

$uudcc\bar{c}uud$ $\sqrt{s} = 5\text{GeV}$ $pp \rightarrow p[J/\psi p]$

Spin Correlations, QCD Color Transparency, and Heavy-Quark Thresholds in Proton-Proton Scattering

CT for baryons A(p,2p)

PUZZLE

D. Dutta et al. / Progress in Particle and Nuclear Physics 69 (2013) 1–27

**Unexpected drop of T in
A(p,2p) at high P_L is not
understood:**

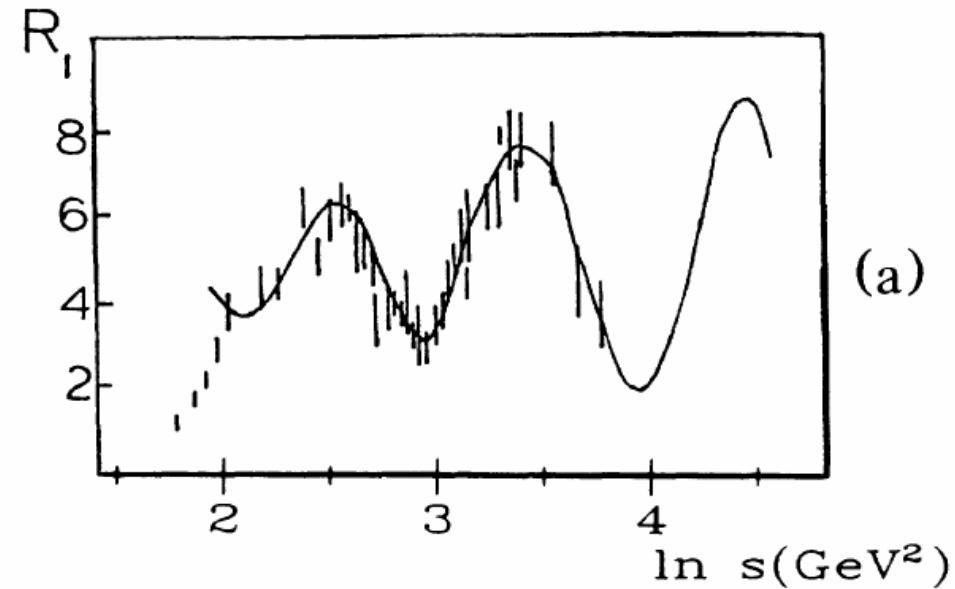

- J. Ralston, B.Pire, PRL 61 (1988) 1823
Nuclear filtering : $f_{pp} = f_{QC} + f_L$
 f_{QC} - quark counting (PLC-size);
 f_L - Ladshoff (normal size);
Attenuation for f_L in nuclear medium
- due to intermediate (very broad,
 $\Gamma \sim 1\text{GeV}$) $6q\bar{c}\bar{c}$ resonance formation
at the charm threshold , S. Brodsky , G. F.
de Teramond, PRL 60(1988) 1924

Another explanation of pp-oscillations and CT bump:

J.P. Ralston, B. Pire.
PRL 61 (1988) 1823;
PRL 49 (1982) 1605

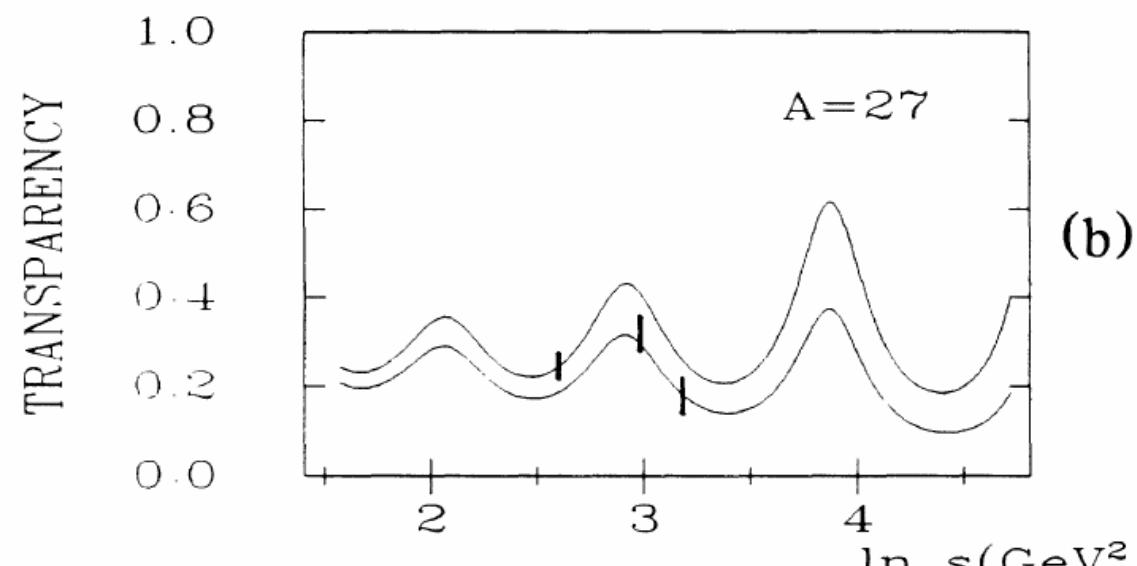

Nuclear filtering mechanism for CT

$$T = \frac{d\sigma^{pA} / dt}{Ad\sigma^{pp} / dt}$$

$$R_1 = s^{10} \frac{d\sigma^{pp}}{dt}$$

(a)

(b)

About phenomenology of pN- elastic scattering at $\sqrt{s_{NN}} = 3\text{-}6 \text{ GeV}$

W.P. Ford, J.W. van Orden, PRC
87 (2013) 014004,
“Regge-model for nucleon-
nucleon spin-dependent
amplitudes”, $s= 6 \text{ GeV}^2$

pp-Regge, see also:
A.Sibirtsev et al. EPJ A(2010)
 $P_L=3 - 50 \text{ GeV}/c$
 $-t < 2(\text{GeV}/c)^2$

No predictions in hard pN- region

Similar data on A_{NN} in pn-pn elastic scattering will be very valuable due to different spin-isospin dependence of p-n ($T=0$) as compared to p-p.
This can be done at NICA SPD.

How to get a double – spin correlations in
 $pn \rightarrow pn$ from $dd \rightarrow pn\bar{p}n$?

Double spin correlations in pn->pn

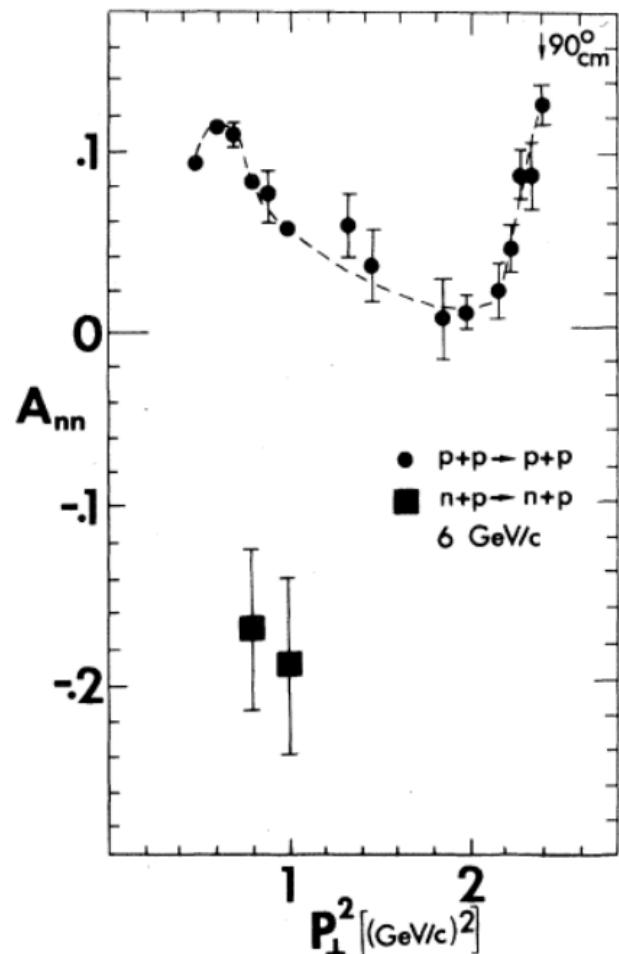

FIG. 2. The spin-spin correlation parameter, A_{nn} , for pure-initial-spin-state nucleon-nucleon elastic scattering at 6 GeV/c is plotted against the square of the transverse momentum. The proton-proton and neutron-proton data are quite different.

spin-Spin Forces in 6-GeV/c Neutron-Proton Elastic Scattering

• Crabb, P. H. Hansen, A. D. Krisch, T. Shima, and K. M. Terwilliger
Laboratory of Physics, The University of Michigan, Ann Arbor, Michigan 48109

$$(d\sigma/dt)_{\uparrow\uparrow} = \langle d\sigma/dt \rangle (1 + 2A + A_{nn}),$$

$$(d\sigma/dt)_{\downarrow\downarrow} = \langle d\sigma/dt \rangle (1 - 2A + A_{nn}),$$

$$(d\sigma/dt)_{\uparrow\downarrow} = (d\sigma/dt)_{\downarrow\uparrow} = \langle d\sigma/dt \rangle (1 - A_{nn}).$$

A > 0

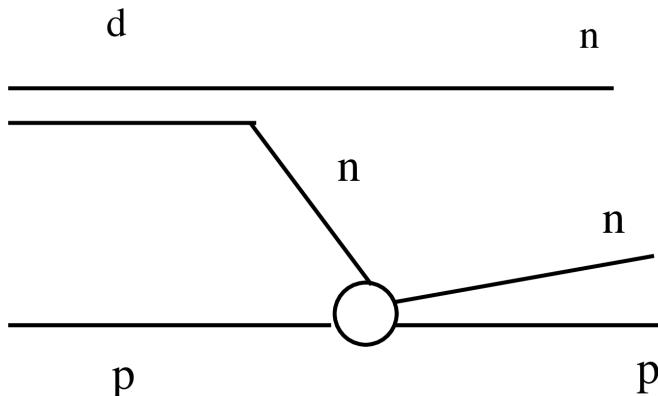

$$\frac{(d\sigma/dt)_{\uparrow\uparrow}}{(d\sigma/dt)_{\uparrow\uparrow}} = \frac{(d\sigma/dt)_{\uparrow\uparrow} + (d\sigma/dt)_{\downarrow\downarrow}}{(d\sigma/dt)_{\uparrow\downarrow} + (d\sigma/dt)_{\downarrow\uparrow}} = \frac{1 + A_{nn}}{1 - A_{nn}}.$$

Spin-Spin Forces in 6-GeV/c Neutron-Proton Elastic Scattering

D. G. Crabb, P. H. Hansen, A. D. Krisch, T. Shima, and K. M. Terwilliger
Randall Laboratory of Physics, The University of Michigan, Ann Arbor, Michigan 48109

Measurement was made of $d\sigma/dt$ for $n_\uparrow + p_\uparrow \rightarrow n + p$ at $P_{\perp}^2 = 0.8$ and 1.0 (GeV/c) 2 at 6 GeV/c . The 6 - GeV/c 53% -polarized neutrons from the 12 - GeV/c polarized deuteron beam at the Argonne zero-gradient synchrotron were scattered from our 75% -polarized proton target. Both spins were oriented perpendicular to the scattering plane. We found large unexpected spin-spin effects in n - p elastic scattering which are quite different from the p - p spin-spin effects.

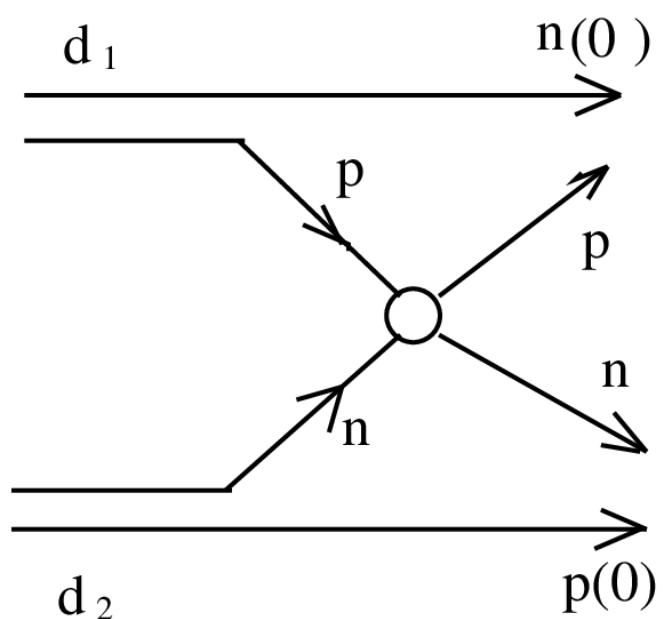

Polarization: 53% for n, 75% for p

onance by a factor of 12.5. By carefully tuning the pulsed quadrupoles, the ZGS staff was able to jump this $0 - \nu_y$ resonance and obtain a beam of 12 - GeV/c deuterons with a neutron polarization of $P_B = (53 \pm 3)\%$.

Measuring the polarization of these neutrons was also a new problem. A fast "uncalibrated"

At NICA SPD

$$d^\uparrow d^\uparrow \rightarrow p(90^\circ) + n(90^\circ) + p_s(0) + n_s(0)$$

Transversally polarized deuterons. Hard pn elastic scattering at 90° . Nucleons $p(0)$ and $n(0)$ are spectators.

The S-wave dominates in the deuterons at $\vec{q}_1 = \vec{q}_2 = 0$

S-waves :

$$\vec{p}_s = \vec{d}_1 / 2; \vec{n}_s = \vec{d}_d / 2 \quad (1)$$

$$A_{\vec{N}\vec{N}}^{dd} \Rightarrow A_{\vec{N}\vec{N}}^{pn} (\theta_{cm}^{pn} = 90^\circ) \quad (\text{for any OZ}) \quad (2)$$

S+D-waves: $\vec{q}_1 \neq 0 \uparrow\uparrow OZ, \vec{q}_2 \neq 0 \uparrow\downarrow OZ$ **OZ || beam**

$$A_{Z,Z}^{dd} \Rightarrow A_{Z,Z}^{NN} = \frac{\sigma_{\nearrow\nearrow} - \sigma_{\nearrow\swarrow}}{\sigma_{\nearrow\nearrow} + \sigma_{\nearrow\swarrow}} \quad (3)$$

ISI@FSI and deviation from the conditions of Eq. (1) are under estimation

TABLE I. Set of the polarization states used in the ${}^1\text{H}(\vec{d}, pp)\vec{n}$ breakup experiment. The maximum polarizations P_Z , P_{ZZ} (for 100% efficiency of transitions in the ion source) and corresponding combinations of the magnetic fields are shown. The x indicates that the magnetic field is switched on, whereas the—indicates that the magnetic field is switched off. I_f denotes the full beam intensity. In the case of transitions with medium field on, the beam intensity is reduced to 2/3 of I_f in the case of 100% efficient transitions.

Polarization states		Magnetic fields				Beam intensity
P_Z	P_{ZZ}	SF1	SF2	MF	WF	
0	0	—	—	—	—	I_f
$+\frac{1}{3}$	+1	x	—	—	—	I_f
$+\frac{1}{3}$	-1	—	x	—	—	I_f
0	+1	x	—	x	—	$\frac{2}{3}I_f$
0	-2	—	x	x	—	$\frac{2}{3}I_f$
$+\frac{2}{3}$	0	x	x	—	—	I_f
$-\frac{2}{3}$	0	—	—	—	x	I_f

$$\mathbf{P}_{yy}=0 \text{ for } \mathbf{P}_y=+2/3, -2/3$$

Comment by N.M. Piskunov

In this case measurement of A_{yy} in $dd \rightarrow pn\bar{p}\bar{n}$ seems to be similar to that for $pp \rightarrow pp$ (See Crabb et al. PRL 1978)

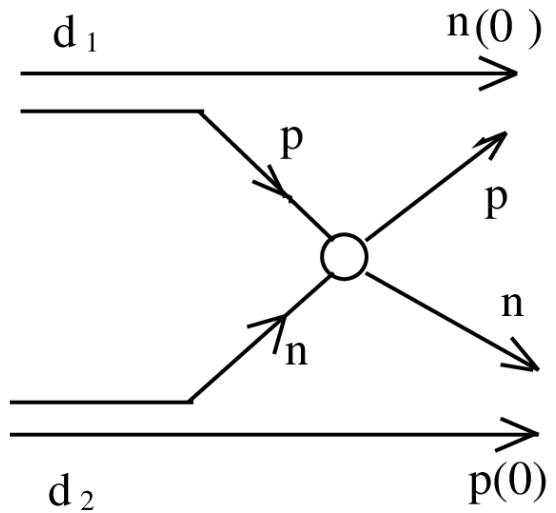

Elements of Formalism for dd->pnpn

$$M_{fi} = \sum_{\sigma'_2 \sigma'_3} \frac{M(d_1 \rightarrow 12')iT_{NN}(2'3' \rightarrow 23)iM(d_2 \rightarrow 3'4)}{(p_{2'}^2 - m_N^2 + i\epsilon)(p_{3'}^2 - m_N^2 + i\epsilon)}$$

$$\begin{aligned} M(d_1 \rightarrow 12') &= -(\varepsilon + q_1^2/m) <\chi_1 \chi_2 | \phi_\lambda > \sqrt{2m_p 2m_n 2m_d} \\ &= -(\varepsilon + q_1^2/m) u(q_1) \frac{1}{\sqrt{4\pi}} (\frac{1}{2} \sigma_1 \frac{1}{2} \sigma_{2'} | 1 \lambda_1) \sqrt{2m_p 2m_n 2m_d} \end{aligned}$$

$$M_{fi} = \sum_{\sigma'_2 \sigma'_3} 2m_d <\chi_1 \chi'_2 | \phi_{\lambda_1} > <\chi'_3 \chi_4 | \phi_{\lambda_2} > T_{NN}(2'3' \rightarrow 23)$$

$A_{y,y}^{d,d}$ CORRELATION FOR $d^\uparrow d^\uparrow \rightarrow pn\bar{p}n$

$$M_{\lambda_1 \lambda_2}^{\sigma_1 \sigma_2 \sigma_3 \sigma_4}(dd \rightarrow pn\bar{p}n) = \sum_{\sigma_p \sigma_n} < \chi_{\sigma_2}(2) \chi_{\sigma_3}(3) | t_{pn} | \chi_{\sigma_p}(p) \chi_{\sigma_n}(n) >$$

$$\times < \chi_{\sigma_1}(1), \chi_{\sigma_p}(p) | \phi_{\lambda_1}(d_1) > < \chi_{\sigma_4}(4), \chi_{\sigma_n}(n) | \phi_{\lambda_2}(d_2) >$$

$$< \chi_{\sigma_1}(1), \chi_{\sigma_p}(p) | \phi_{\lambda_1}(d_1) > = u(q_1) \left(\frac{1}{2} \sigma_1 \frac{1}{2} \sigma_p | 1 \lambda_1 \right),$$

$$< \chi_{\sigma_4}(4), \chi_{\sigma_n}(n) | \phi_{\lambda_2}(d_2) > = u(q_2) \left(\frac{1}{2} \sigma_1 \frac{1}{2} \sigma_n | 1 \lambda_2 \right),$$

$$\begin{aligned}
d\sigma_{\lambda_1\lambda_2} &= \frac{1}{9} \sum_{\sigma_1\sigma_2\sigma_3\sigma_4} M_{\lambda_1\lambda_2}^{\sigma_1\sigma_2\sigma_3\sigma_4}(dd \rightarrow pn\bar{p}n)(M_{\lambda_1\lambda_2}^{\sigma_1\sigma_2\sigma_3\sigma_4}(dd \rightarrow pn\bar{p}n))^* = \\
&= \frac{1}{9} \sum_{\sigma_1\sigma_2\sigma_3\sigma_4} | < \chi_{\sigma_2}(2) \chi_{\sigma_3}(3) | t_{pn} | \chi_{\sigma_p=\lambda_1-\sigma_1}(p) \chi_{\sigma_n=\lambda_2-\sigma_4}(n) > |^2 \\
&\quad \times (\frac{1}{2}\sigma_1 \frac{1}{2}\lambda_1 - \sigma_1 |1\lambda_1\rangle^2 (\frac{1}{2}\sigma_4 \frac{1}{2}\lambda_2 - \sigma_4 |1\lambda_2\rangle^2 u(q_1)^2 u(q_2)^2.
\end{aligned}$$

$$\boxed{\lambda_1 = +1, \lambda_2 = \pm 1}$$

$$\begin{aligned}
d\sigma_{\lambda_1=+1\lambda_2=+1} &= \sum_{\sigma_2\sigma_3} u(q_1)^2 u(q_2)^2 | < \chi_{\sigma_2}(2) \chi_{\sigma_3}(3) | t_{pn} | \chi_{\sigma_p=+\frac{1}{2}}(p) \chi_{\sigma_n=+\frac{1}{2}}(n) > |^2 \\
d\sigma_{\lambda_1=+1\lambda_2=-1} &= \sum_{\sigma_2\sigma_3} u(q_1)^2 u(q_2)^2 | < \chi_{\sigma_2}(2) \chi_{\sigma_3}(3) | t_{pn} | \chi_{\sigma_p=+\frac{1}{2}}(p) \chi_{\sigma_n=-\frac{1}{2}}(n) > |^2
\end{aligned}$$

$A_{y,y}^{d,d}$ CORRELATION FOR $d^\dagger d^\dagger \rightarrow pn\bar{p}n$

$$A_{y,y}^{dd} = \frac{d\sigma^{\uparrow\uparrow} - d\sigma^{\uparrow\downarrow}}{d\sigma^{\uparrow\uparrow} + d\sigma^{\uparrow\downarrow}} = \frac{d\sigma_{\lambda_1=+1\lambda_2=+1} - d\sigma_{\lambda_1=+1\lambda_2=-1}}{d\sigma_{\lambda_1=+1\lambda_2=+1} + d\sigma_{\lambda_1=+1\lambda_2=-1}}$$

$$A_{y,y}^{dd \rightarrow pn\bar{p}n} = A_{y,y}^{pn \rightarrow pn}$$

$$A_{z,z}^{dd} = A_{z,z}^{pn}$$

But what about $\lambda = 0$?

What about $\lambda = 0$?

Polarization of the beam

Unpolarized deuteron beam

$$N_+ = N_- = N_0 \equiv n$$

$$m = +1 \quad m = -1 \quad m = 0$$

$$P_Y = \frac{\mathcal{N}_{m=+1} - \mathcal{N}_{m=-1}}{\mathcal{N}_{m=+1} + \mathcal{N}_{m=-1} + \mathcal{N}_{m=0}},$$

$$P_{YY} = \frac{\mathcal{N}_{m=+1} + \mathcal{N}_{m=-1} - 2\mathcal{N}_{m=0}}{\mathcal{N}_{m=+1} + \mathcal{N}_{m=-1} + \mathcal{N}_{m=0}}$$

N ₊ =2n	0	$n \Rightarrow P_Y = \frac{2}{3}, P_{YY} = 0$
--------------------	---	---

0	N ₋ =2n	$n \Rightarrow P_Y = -\frac{2}{3}, P_{YY} = 0$
---	--------------------	--

Two sets of deuterons beams:

$$P_1 = +\frac{2}{3}, P_2 = +\frac{2}{3}$$

$$P_1 = +\frac{2}{3}, P_2 = -\frac{2}{3}$$

N₁

$$A_{YY}^{dd} = \frac{\mathcal{N}_1 - \mathcal{N}_2}{\mathcal{N}_1 + \mathcal{N}_2}$$

N₂

In terms of $d\sigma_{\lambda_1 \lambda_2}$

$$A_{YY}^{dd} = \frac{2 \cdot 2d\sigma_{++} + 2d\sigma_{+0} + 2d\sigma_{0+} + d\sigma_{00} - (2 \cdot 2d\sigma_{+-} + 2d\sigma_{+0} + 2d\sigma_{0-} + d\sigma_{00})}{2 \cdot 2d\sigma_{++} + 2d\sigma_{+0} + 2d\sigma_{0+} + d\sigma_{00} + (2 \cdot 2d\sigma_{+-} + 2d\sigma_{+0} + 2d\sigma_{0-} + d\sigma_{00})}$$

Using R_3 -invariance

$$A_{YY}^{dd} = \frac{1}{2} \frac{d\sigma_{++} - d\sigma_{+-}}{d\sigma_{++} - d\sigma_{+-}} = \frac{1}{2} A_{YY}^{NN}$$

OUTLOOK

- We do not have good understanding of the most fundamental process, as hard elastic NN-scattering , in particularly at $\sqrt{s} = 3-10\text{GeV}$ and their relation to QCD (CT,CCR...)
- Available data on double spin correlation in hard $\text{pp} \rightarrow \text{pp}$ are intriguing. Theoretical interpretation is questionable.
- A similar data on A_{NN} in hard $\text{pn} \rightarrow \text{pn}$ will provide important independent information on the short-range NN-dynamics
- Measurement of A_{yy}^{dd} in $d^\uparrow d^\uparrow \rightarrow p(90^\circ) + n(90^\circ) + p_s(0) + n_s(0)$ will provide A_{yy}^{pn} in case of the S-wave d.w.f. dominance

D-wave contribution, $q_1 \neq 0, q_2 \neq 0$

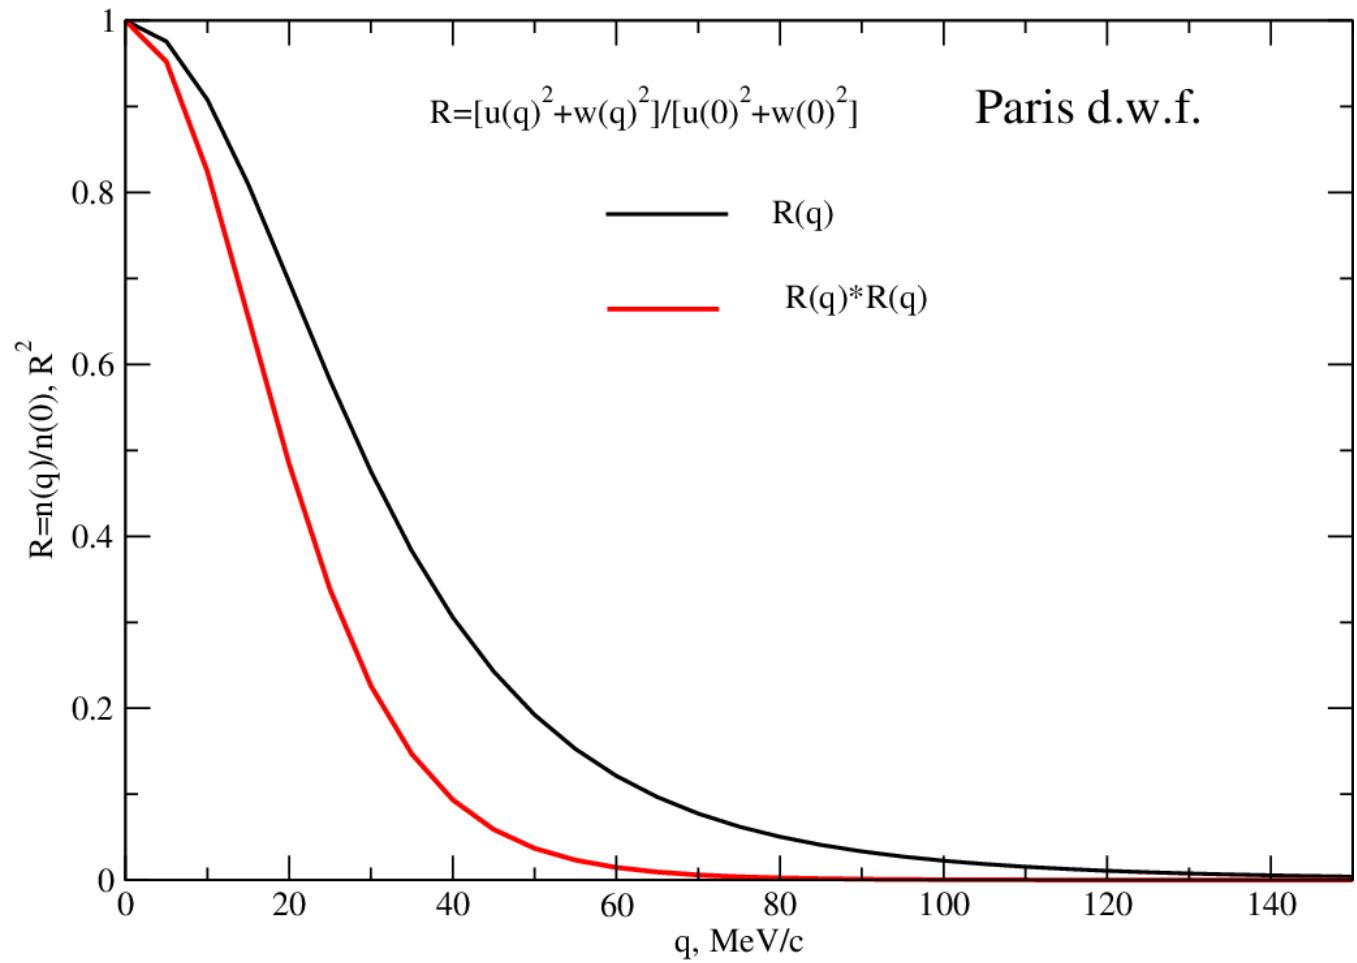

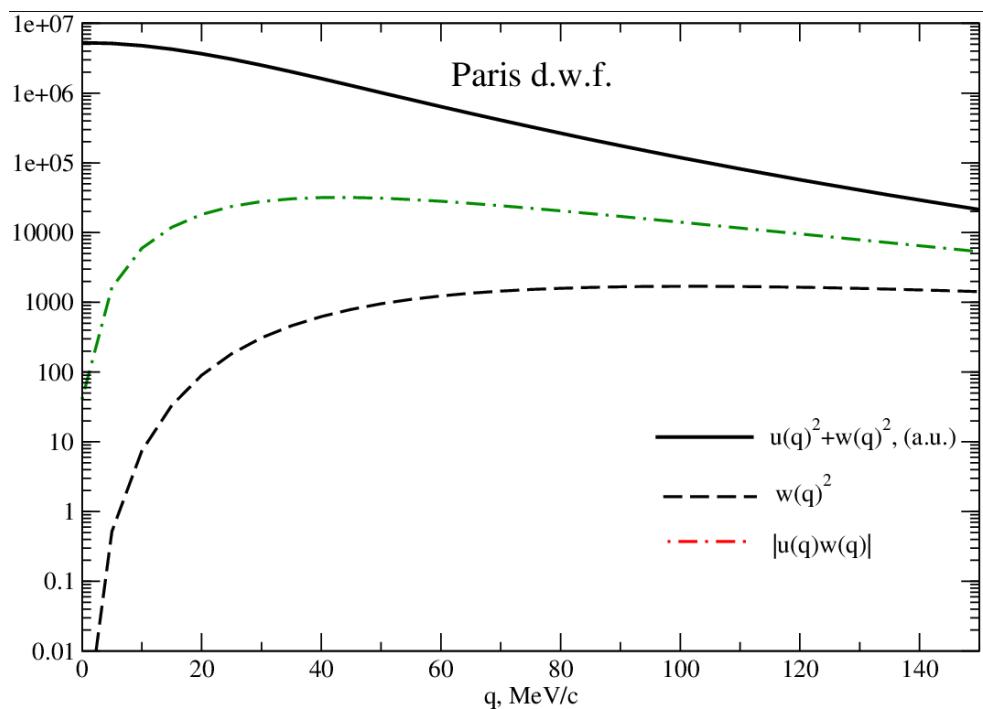

$$\begin{aligned} <\chi_{\sigma_1}(1), \chi_{\sigma_p}(p) | \phi_{\lambda_1}(d_1)> = u(q) (\frac{1}{2}\sigma_1 \frac{1}{2}\sigma_p | 1\lambda_1) + \\ + w(q) \sum_m (2\lambda_1 - 11m | 1\lambda_1) (\frac{1}{2}\sigma_1 \frac{1}{2}\sigma_p | 1m) Y_{2,\lambda_1-m}(\hat{\mathbf{q}}). \end{aligned}$$

$$\text{For OZ}\uparrow\uparrow \mathbf{q} \quad \quad \quad Y_{2,\mu}(\hat{\mathbf{q}}) = \delta_{\mu,0} Y_{20}(0,0)$$

$$\lambda_1 - m = 0, \lambda_1 = m \quad \quad \quad (2011|11) = (201-1|1-1) = 1/\sqrt{10}$$

$$Y_{20}(\theta, \phi) = \frac{1}{4} \sqrt{\frac{5}{\pi}} (3 \cos^2 \theta - 1) = \frac{1}{2} \sqrt{\frac{5}{\pi}}$$

Nucleon momentum distribution in the deuteron

$$(2011|11) = (201 - 1|1 - 1) = 1/\sqrt{10}$$

$$Y_{20}(\theta, \phi) = \frac{1}{4}\sqrt{\frac{5}{\pi}}(3\cos^2\theta - 1) = \frac{1}{2}\sqrt{\frac{5}{\pi}}$$

S-wave

$$u(q)\left(\frac{1}{2}\sigma_1 \frac{1}{2}\sigma_p | 1\lambda_1\right)$$

D-wave

$$w(q)(201\lambda_1 | 1\lambda_1)\left(\frac{1}{2}\sigma_1 \frac{1}{2}\sigma_p | 1\lambda_1\right) Y_{20}(0)$$

CT for mesons production is well established

$^4He(\gamma, \pi p)$

D. Dutta et al. / Progress in Particle and Nuclear Physics 69 (2013) 1–27

15

$E_\gamma = 2.25\text{GeV}$

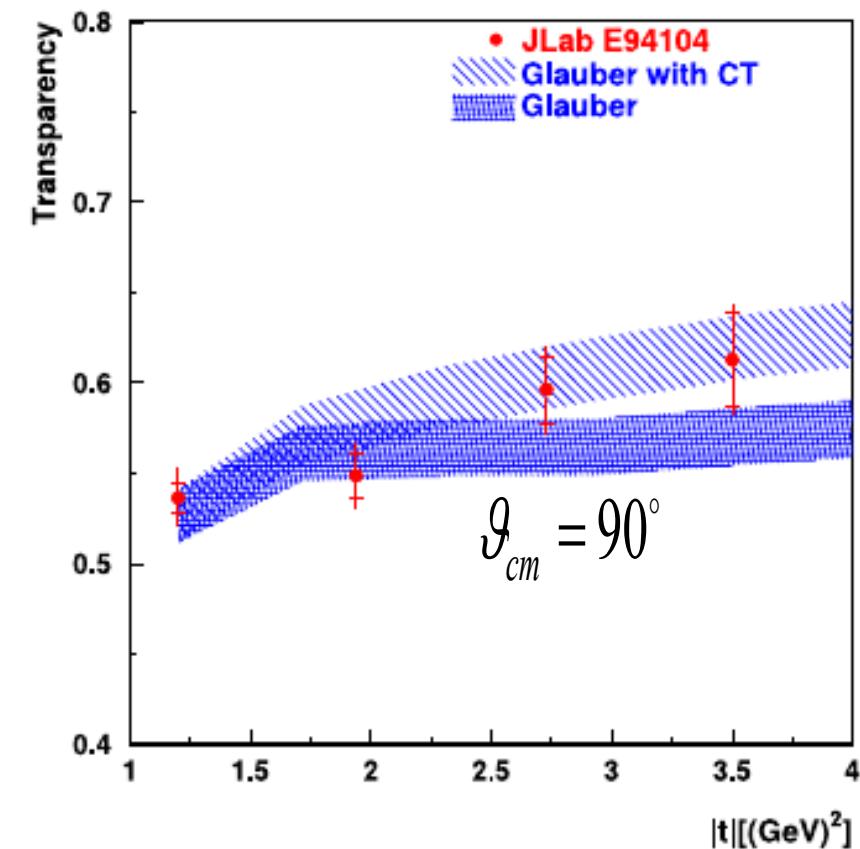

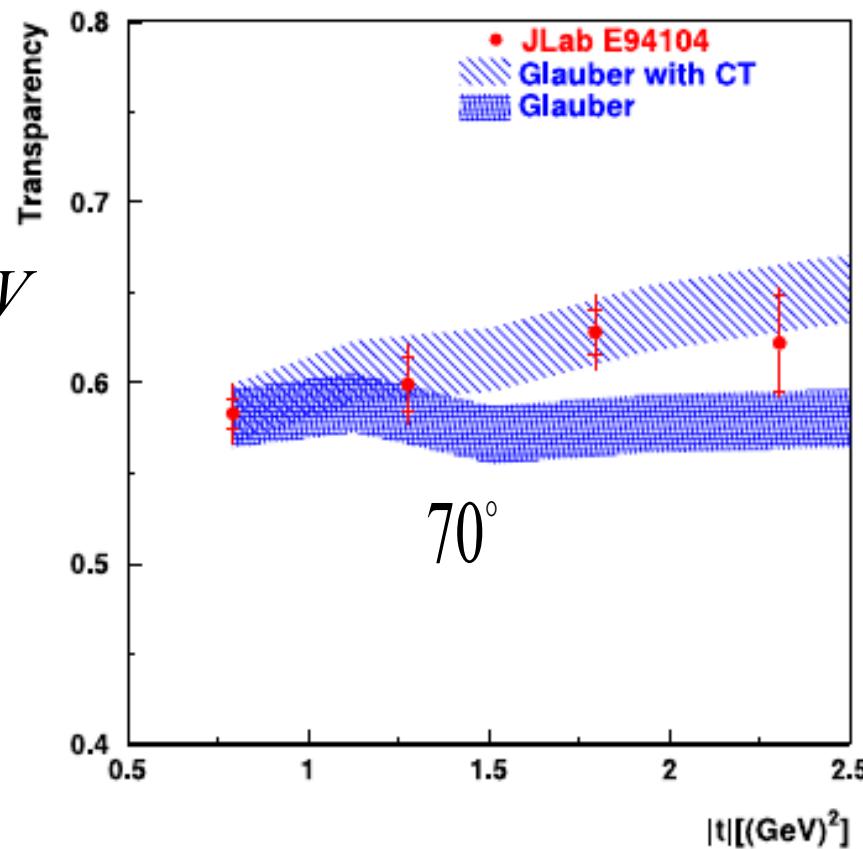

Fig. 13. The nuclear transparency of $^4He(\gamma, p\pi)$ at $\theta_{cm}^\pi = 70^\circ$ (left) and $\theta_{cm}^\pi = 90^\circ$ (right), as a function of momentum transfer square $|t|$ [80]. The inner error bars shown are statistical uncertainties only, while the outer error bars are statistical and point-to-point systematic uncertainties (2.7%) added in quadrature. In addition there is a 4% normalization/scale systematic uncertainty which leads to a total systematic uncertainty of 4.8%.

DIBARYON RESONANCES

D_{IJ}

F.J. Dyson, N.-H. Xuong,
PRL **13**, 815 (1964):

Search for non-strange
isovector ($I=1$) and
isotensor ($I=2$) dibaryons.

Indication to the D_{21} :

P. Adlarson et al. PRL **121** (2018)

in $pp \rightarrow pp\pi^+\pi^-$
at 1 GeV

TABLE III. The mass of non-strange dibaryons (MeV).

	Y	S	I	J	[f]	M	$M_{\text{exp.}}$
D_{01}	2	0	0	1	[33]	1876	1876
D_{10}	2	0	1	0	[42]	1883	1878?
D_{03}	2	0	0	3	[33]	2351	2380
D_{30}	2	0	3	0	[6]	2394	?
D_{12}	2	0	1	2	[42]	2168	2148?
D_{21}	2	0	2	1	[51]	2182	2140?
