20mm Straw Drift times

20mm, during TB

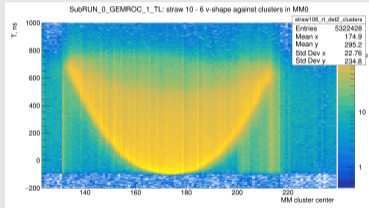

20mm, beamdump

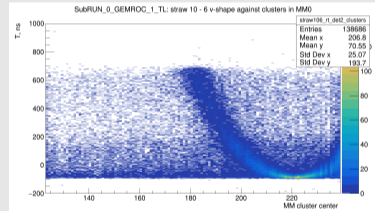

20mm Straw RT

20mm, during TB

Setup should be rotated ~ 1.27 degrees (back to Jura)

20mm, beamdump

Statistics

During TB

- 20mm, HV 2100: About 9.8B / straw (need 200K)
- 10mm, HV 1750: About 29B / straw (need 100K)
- 5mm, HV 1500: About 12B / straw (need 50K)

During TB, with Timepix data:

Maximal possible values:

- 20mm, HV 2100: About 10M / straw (need 200K)
- 10mm, HV 1750: About 18M / straw (need 100K)
- 5mm, HV 1500: About 10M / straw (need 50K)

BeamDump

- 20mm, HV 2100: About 30K / straw (need 200K)
- 10mm, HV 1750: About 45K / straw (need 100K)
- 5mm, HV 1500: About 10K / straw (need 50K)
- 5mm, HV 1350: datataking in progress

Straw rating

Straw rating

Description

- Green: good
- Blue: average
- Red: bad
- White: Problematic (not connected?)

Additional

- Most of "white" 5mm straws seems not dead, but has narrow noise peak.
- If the set step lower, no signal from straws. Otherwise, high noise.
- May be the tiger problem? I do not see that on "test" tiger.
