

## Track scintillation detector

*Monday 30 October 2023 21:45 (15 minutes)*

A prototype of a track scintillation detector has been developed. The detector is necessary to obtain two-dimensional spatial information about the processes under study. The detector is based on a monolithic cubic scintillator, viewed from different sides by a highly sensitive Sensls SiPM matrix. The report describes a technique for obtaining an image of a track of a passing particle through a scintillator.
