We will use the numerical values of the Wilson coefficients from [24] obtained at the scale $\mu = 4$ GeV at leading order with $\Lambda_{MS}^{(5)} = 225$ MeV. One has $C_2 = 1.141$ and $C_1 = -0.310$ that gives $a_1 = C_2 + \xi C_1 = 1.038$. Note that this value has been also used in the paper [25]. It differs from the most old papers where the color-suppressed factor ξ was set to zero.

Nonleptonic decays of B_c meson

The nonleptonic B_c decay widths in terms of the helicity amplitudes are given by

$$\Gamma(B_c \rightarrow \eta_c D_q) = N_W \{ a_1 f_{D_q^-} m_{D_q^-} H_t^{B_c \rightarrow \eta_c}(m_{D_q^-}^2) + a_2 f_{\eta_c} m_{\eta_c} H_t^{B_c \rightarrow D_q^-}(m_{\eta_c}^2) \}^2,$$

$$\begin{aligned} \Gamma(B_c \rightarrow \eta_c D_q^*) &= N_W \{ a_1 f_{D_q^{*-}} m_{D_q^{*-}} H_0^{B_c \rightarrow \eta_c}(m_{D_q^{*-}}^2) \\ &\quad - a_2 f_{\eta_c} m_{\eta_c} H_t^{B_c \rightarrow D_q^{*-}}(m_{\eta_c}^2) \}^2, \end{aligned}$$

$$\begin{aligned} \Gamma(B_c \rightarrow J/\psi D_q) &= N_W \{ -a_1 f_{D_q^-} m_{D_q^-} H_t^{B_c \rightarrow J/\psi}(m_{D_q^-}^2) \\ &\quad + a_2 f_{J/\psi} m_{J/\psi} H_0^{B_c \rightarrow D_q^-}(m_{J/\psi}^2) \}^2, \end{aligned}$$

$$\begin{aligned} \Gamma(B_c \rightarrow J/\psi D_q^*) &= N_W \sum_{i=0,\pm} \{ a_1 f_{D_q^{*-}} m_{D_q^{*-}} H_i^{B_c \rightarrow J/\psi}(m_{D_q^{*-}}^2) \\ &\quad + a_2 f_{J/\psi} m_{J/\psi} H_i^{B_c \rightarrow D_q^{*-}}(m_{J/\psi}^2) \}^2, \end{aligned}$$

Conclusion

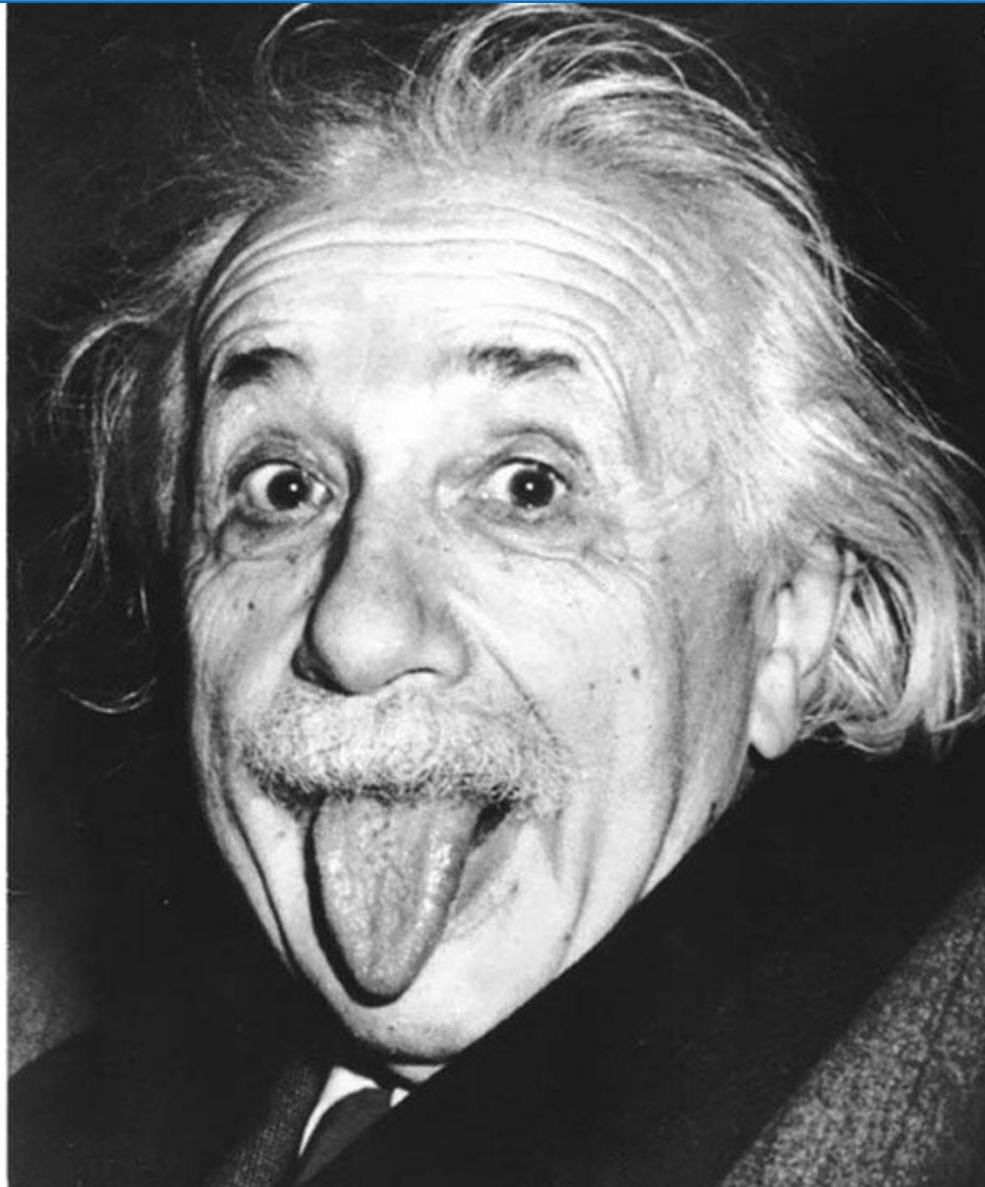

We have found that the theoretical predictions for the ratio $\mathcal{R}_{J/\psi}$ are more than 2σ less than the experimental data. This may indicate on the possibility of New physics effects in this decay.

At the same time the ratios of the branching fractions $\mathcal{R}_{\pi^+/\mu^+\nu}$ and \mathcal{R}_{K^+/π^+} are in good agreement with the LHCb data and other theoretical approaches.

We found that our prediction for the ratios $\mathcal{R}_{D_s^*/D_s}$ and $\Gamma_{\pm\pm}/\Gamma$ are consistent with measurements and other approaches. The results for the ratios \mathcal{R}_{D_s/π^+} and $\mathcal{R}_{D_s^*/\pi^+}$ are smaller than the measured values but the discrepancies do not exceed two standard deviations.

Since our result for $\mathcal{R}_{J/\psi}$ is different from the data at the level of 2σ , we can urge to more precise measurement of the $B_c \rightarrow J/\psi \ell \bar{\nu}_\ell$ channel which currently has quite large uncertainties. This might be very important since it may imply that the new physics (if there is any) has strong couplings to the leptons but not hadrons.

Thank you!
