

Functional reduction of Feynman integrals

Tuesday, 24 July 2018 15:20 (30 minutes)

An algorithm for finding functional equations allowing to essentially simplify evaluation of Feynman integrals is proposed. With the help of such functional equations new compact analytic results for the one loop 3-, 4- and 5- point functions with massless propagators are derived. The obtained results are valid for arbitrary space-time dimension and arbitrary values of kinematical variables.
