

Neutron transfer in reactions $7\text{Li}, 48\text{Ca} + 197\text{Au}$ at above-barrier energies

Tuesday 2 July 2024 10:10 (20 minutes)

Studies of neutron transfers with the formation of neutron-excess Au isotopes in the reaction are presented for reactions $7\text{Li}, 48\text{Ca} + 197\text{Au}$. Using the activation method, the formation cross sections for target-like products were measured. An assembly of several gold targets was irradiated with an ion beam 48Ca at energies 228, 257, 286 MeV. Total flux of particles passing through the collector was measured by elastic scattering on the target Au (2 μm) located after the activation stack [1].

Experimental cross sections for isotopes $191\text{--}203\text{Au}$ (in reaction $48\text{Ca}+197\text{Au}$) were obtained, which were produced in the stripping and pick-up neutrons, up-to ± 6 neutrons respectively. The time-dependent Schrödinger equation for the outer neutrons was used to calculate the probability of neutron transfer. The isotopic distributions obtained from measurements were compared with calculations from the TDSE approach and the Grazing code. [3][4] (fig.1).

Fig.1. Mass distribution of $197\pm x\text{Au}$ isotopes nuclear in stripping and pickup neutrons in the reaction $48\text{Ca} + 197\text{Au}$ at energies of $E_{\text{lab}} = 228$ (a). Experimental data is represented by circles; calculations using the Grazing code are shown as red curves (with evaporation) and black curves (without evaporation); calculations within the TDSE approach are indicated by asterisks

These results offer valuable insights into the feasibility of generating neutron-rich nuclei through neutron transfer reactions and extend the prospects for producing exotic neutron-rich nuclei by selecting appropriate combinations of projectiles and targets.

Similar study was carried out for the 7Li (70 MeV)+Au reaction. Neutron transfer reaction for 1n and 2n channels were observed as well as neutron evaporation channels for fusion reaction, leading to the formation of compound nucleus. Data analyze for this reaction is still in progress now.
