Relativistic equation for four-nucleon system

Wednesday 3 July 2024 12:40 (15 minutes)

The paper generalizes the four-particle integral Faddeev-Yakubovsky equation to the relativistic case. The obtanied system of integral equations is solved by the iteration method and the binding energy and amplitudes of states of the helium-4 nucleus are found. The rank-one separable Yamaguchi potential is used as the NN interaction potential. In the calculations the only states with zero orbital momentum are considered - S states. The results of the calculation are compared with non-relativistic calculations and experimental value.

Section

Nuclear structure: theory and experiment
