

Analysis of phi meson production in the BM@N experiment

Tuesday 29 October 2024 15:35 (15 minutes)

This work is devoted to the search for phi mesons after collision of Xe beams with a CsI target at $E = 3.8$ AGeV at the BM@N experiment (JINR, Dubna). Both MC and experimental data were analyzed and peaks in the invariant mass distribution corresponding to phi mesons were obtained. The future aim is to increase our understanding of the transition from baryonic matter to (quark-gluon plasma) QGP.
