From Galileo Galilei to Computer Tomography

Georgy Shelkov (JINR,DLNP)

JINR AYSS Conference 30 October 2024

My personal point of view on some facts in the history of Science

Outline:

- Introduction.
- History of the discovery of X-rays and the idea of X-ray tomography.
- Implementation of the idea of computed tomography.
- Trends in the development of computed tomography.
- Conclusion.

I want to start by asking you a question:

Which invention of Humanity or Mankind most significantly distinguishes us now from all other animals on Earth?

I want to start by asking you a question:
Which invention of Humanity or Mankind most significantly distinguishes us now from all other animals on Earth?

Ability to record the results of their activities!

I want to start by asking you a question:
Which invention of Humanity or Mankind most significantly distinguishes us now from all other animals on Earth?

More than 3000 year old the Humankind is writing the
Book of Knowledge.

How a 2D X-ray image differs from a 3D CT scan ?

How a 2D X-ray image differs from a 3D CT scan ?

How a 2D X-ray image differs from a 3D CT scan ?

About 70 years have passed since the creation of the first CT scanner in 1971. The schematic diagram remains the same:

- X-ray tube;
- X-ray detector;
- movement mechanics unit;
- data processing system.

How a 2D X-ray image differs from a 3D CT scan ?

About 70 years have passed since the creation of the first CT scanner in 1971. The schematic diagram remains the same:

- X-ray tube;
- X-ray detector;
- movement mechanics unit;
- data processing system.

In the following we will consider the situation with X-ray image detectors - the most high-tech elements of modern CT scanners.

What are the features/difficulties of x-ray image registration?

An ideal image detector should be not transparent to the type of radiation it detects and absorb it completely.

Examples for visible light: the retina of the eye, photographic films, CCD matrices (made from silicon) in modern gadgets.

What are the features/difficulties of x-ray image registration?

An ideal image detector should be not transparent to the type of radiation it detects and absorb it completely.

Examples for visible light: the retina of the eye, photographic films, CCD matrices (made from silicon) in modern gadgets.

Well known that particle detectors can only register charged particles. It is possible to register a neutrally one too (for example, X-rays) if this particle could "turn" into a low-energy gamma quantum (visible light)

What are the features/difficulties of x-ray image registration?

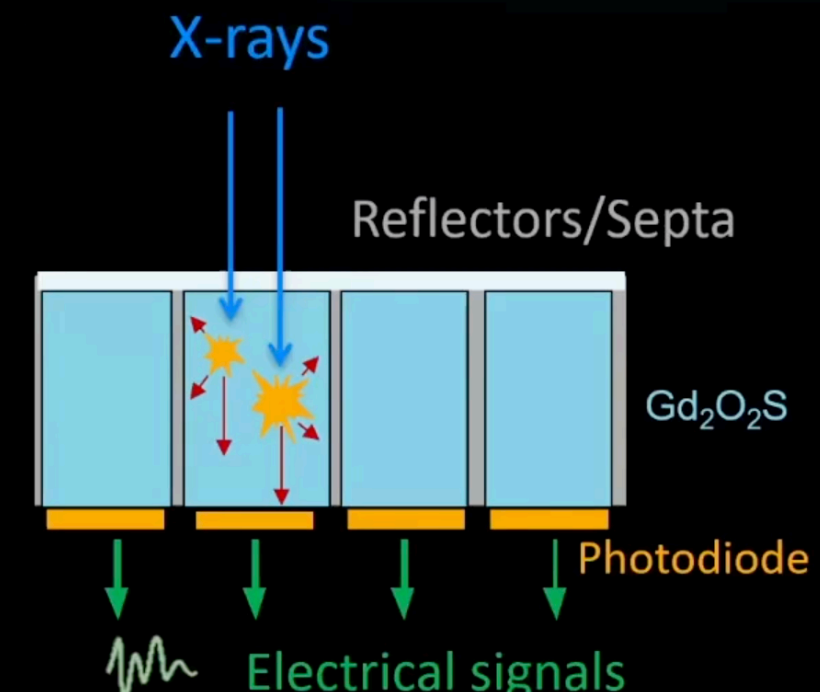

An ideal image detector should be not transparent to the type of radiation it detects and absorb it completely.

Examples for visible light: the retina of the eye, photographic films, CCD matrices (made from silicon) in modern gadgets.

Well known that particle detectors can only register charged particles. It is possible to register a neutrally one too (for example, X-rays) if this particle could "turn" into a low-energy gamma quantum (visible light) or a charged particle.

MAYO CLINIC

Energy integrating *scintillating* detectors

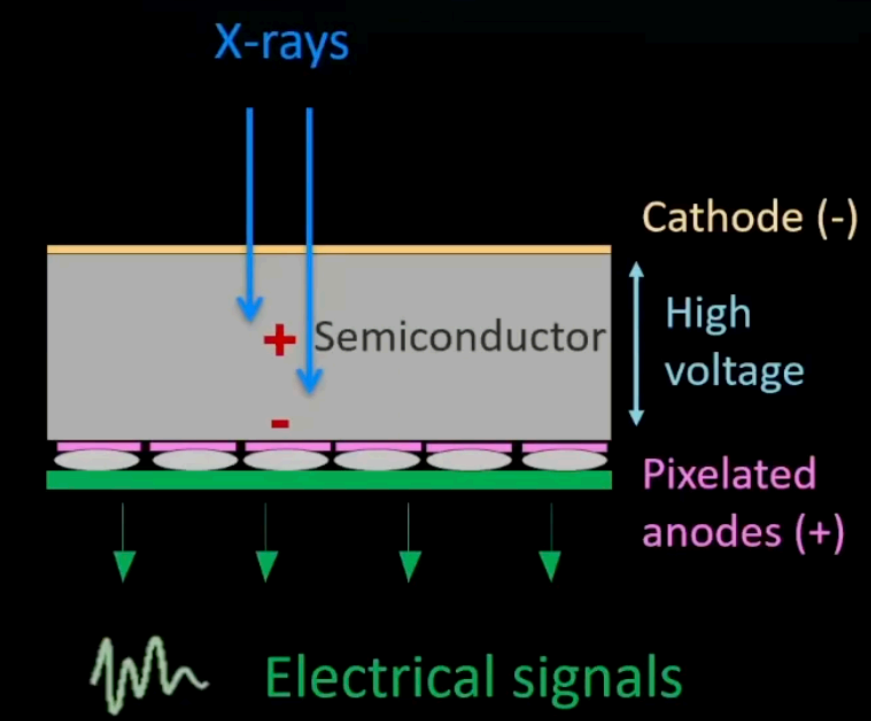

- ▶ No information about individual photon
- ▶ Septa required to stop spread of visible light

Signal proportional to sum of **All** photon energies

MAYO CLINIC

Photon counting detectors

- ▶ Electrons and holes move through the semiconductor and induce fast signal pulses (ns)
- ▶ No septa required

Signal proportional to energy of **individual** photon

What is a modern detector for registration of X-ray images?

What X-ray sources are used in CT scanners?

What is a modern detector for registration of X-ray images?

What X-ray sources are used in CT scanners?

Almost all CT scanners use X-ray tubes as a source of X-rays. This is a cheap and mass-produced device. X-ray tubes produce X-rays in a wide energy spectrum.

What is a modern detector for registration of X-ray images?

How can an X-ray be “turn” to a charged particle?

X-ray tube spectrum $V=80\text{kV}$

What is a modern detector for registration of X-ray images?

How can an X-ray be “turn” to a charged particle?

For the energy range of X-rays from an X-ray tube $\sim(10-100)\text{kV}$, the main effect by which an X-ray can "turn" into a charged electron is the photo-effect in the substance.

X-ray tube spectrum $V=80\text{kV}$

What is a modern detector for registration of X-ray images?

How can an X-ray be “turn” to a charged particle?

For the energy range of X-rays from an X-ray tube $\sim(10-100)\text{kV}$, the main effect by which an X-ray can "turn" into a charged electron is the photo-effect in the substance.

The cross section (probability) of this effect is described by such a formula. It is clear from it that probability depends very strongly on the charge of the nucleus or the ordinal number (**Z**) in the periodic table.

X-ray tube spectrum $V=80\text{kV}$

$$\sigma_{\Phi} = C_1 Z^{4.5} E^{-3.5}$$

What is a modern detector for registration of X-ray images?

How can an X-ray be converted into a charged particle?

The problem is that silicon (Si) absorbs visible light very well, but is practically transparent to X-rays.

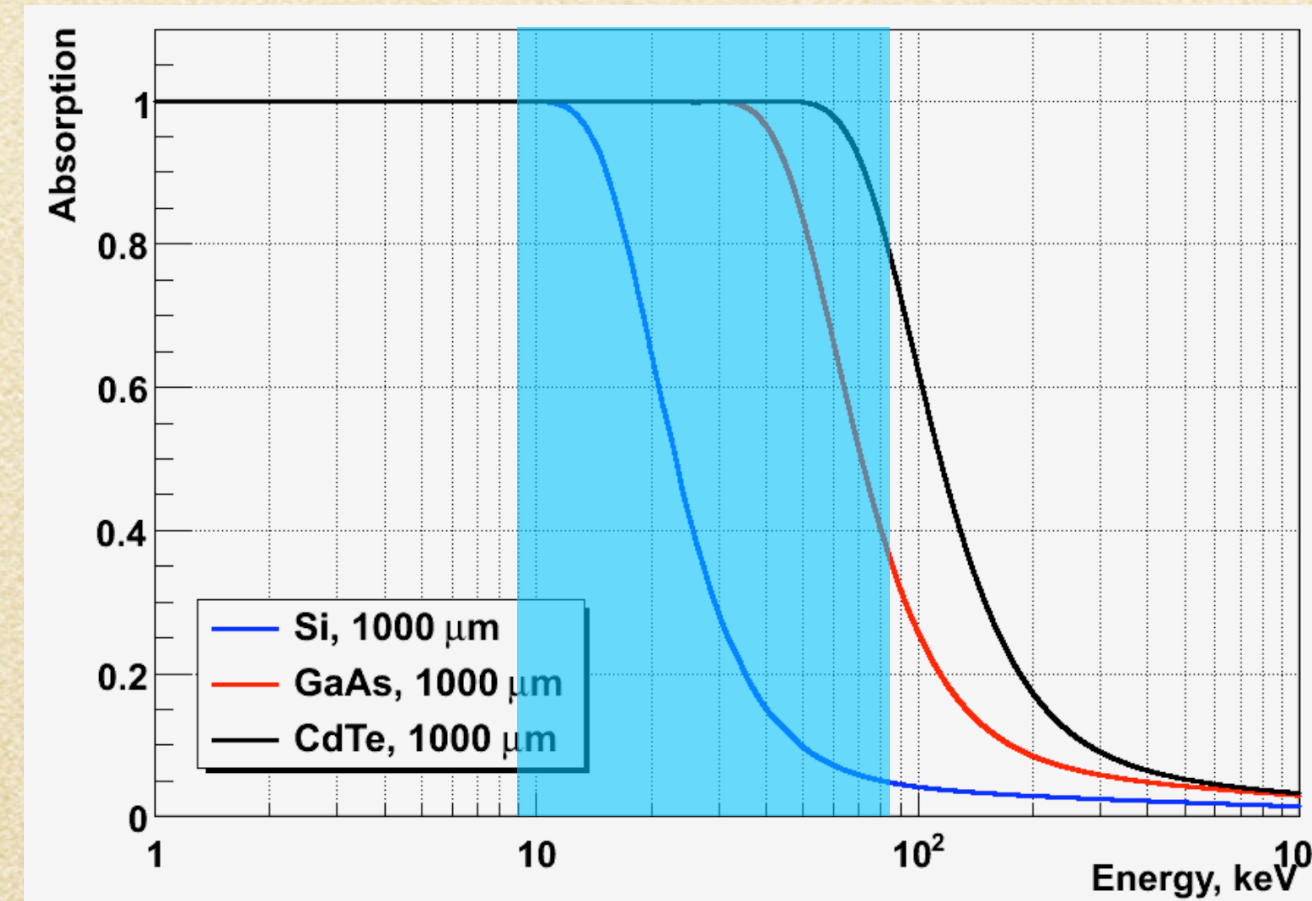

That is why the currently widespread X-ray image detectors use a two-stage registration principle:

X-rays are converted to light in heavy scintillator crystals (CsJ, ...); and this light is detected in Si-based photodetectors.

The **main disadvantage** of this scheme is that the possibility of **measuring the energy of the absorbed X-ray quantum is lost.**

X-ray tube spectrum V=80kV

Z(Si)=14; Z(GaAs)=32; Z(CdTe)=50
