The rare gas clusters within Faddeev approach

Wednesday, 13 June 2018 12:00 (10 minutes)

This work is aimed at a theoretical investigation of the rare gas atomic clusters. Bound state energies and wave functions have been calculated. Differential Faddeev equations in the total angular momentum representation are used for the binding energies calculations of helium and neon trimer system. The results obtained are compared with previous published results.

Presenter: Mr KOROBITSIN, Artem (Bogoliubov Laboratory of Theoretical Physics, Joint Institute for Nuclear Research)
