A new service - HLIT-VDI

A new service - HLIT-VDI – has been developed for shared use of applied software packages on the HybriLIT cluster using GUI (graphical user interface). By means of this service, it is now possible to work with applied software packages such as Wolfram Mathematica, Maple, MATLAB, Geant4, etc. via remote access to the virtual machines (VM) in the framework of the HybriLIT cluster. The developed service allows carrying out computations in the frames of VMs and massive computations using the resources of the cluster.
