Outline

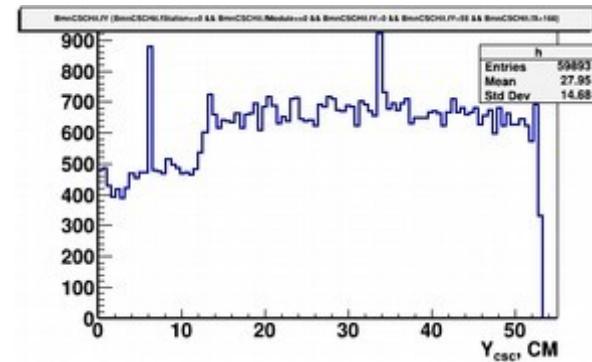

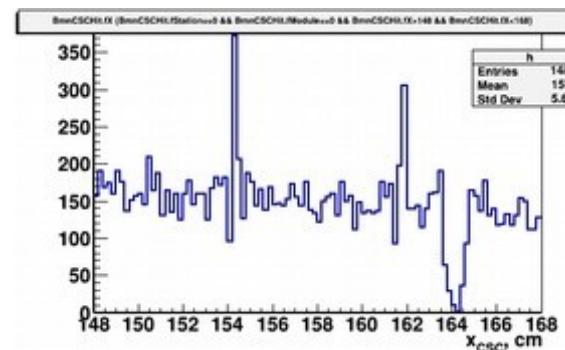

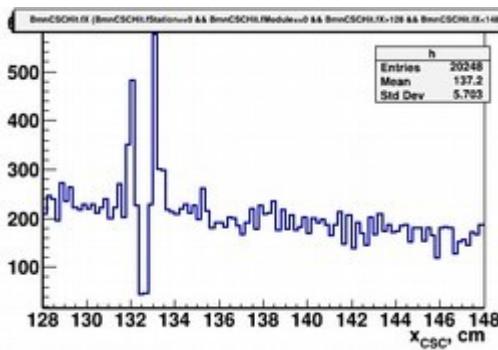

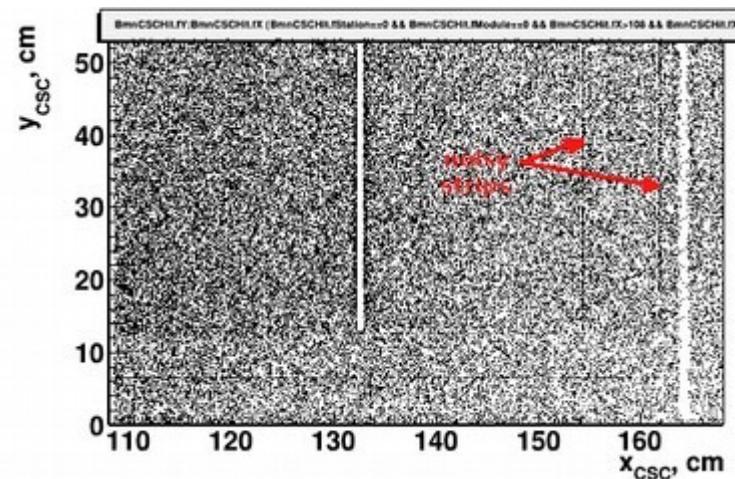

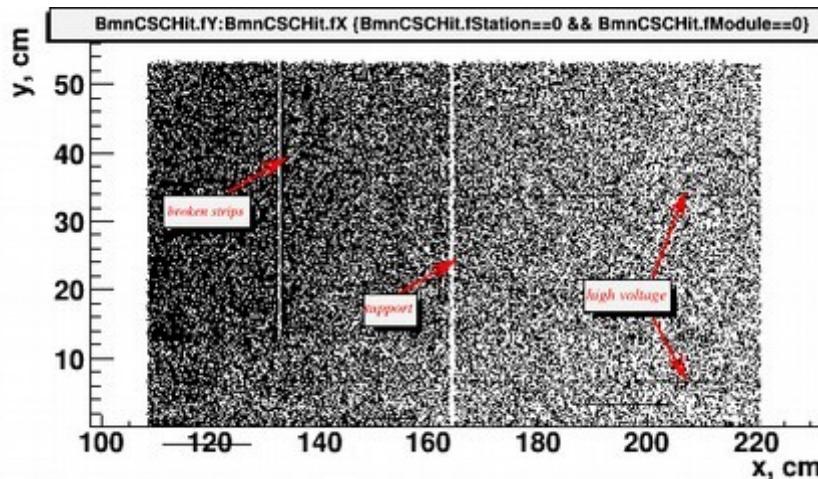

1. Run with xenon beam
 - ✓ Small CSCs numbering
2. Data analysis
 - ✓ Bad zones in CSC modules
 - ✓ Z shift
 - ✓ X and Y shifts
3. Summary

Small CSCs numbering

The four small CSCs are indicated by red arrows. Top module – 0, bottom - 1

Bad zones in CSC0_0

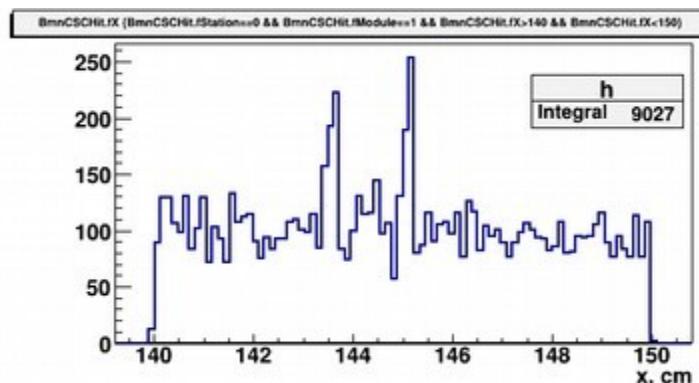

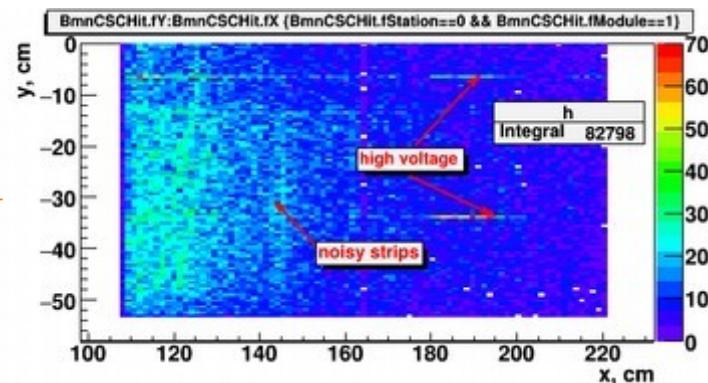

Broken strips, mechanical support, high voltage, noisy strips

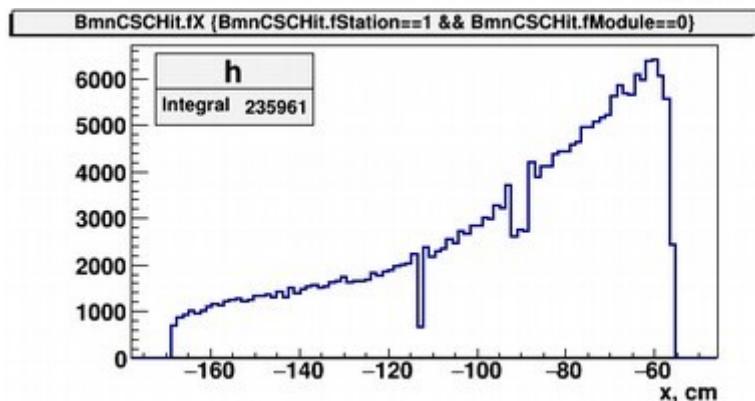

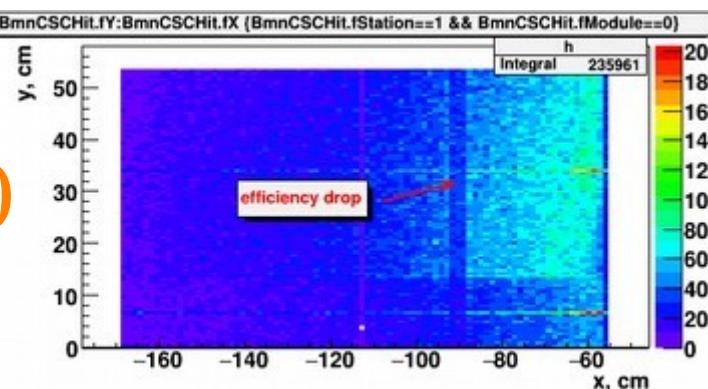

Bad zones in CSC0_1 and CSC1_0

CSC0_1

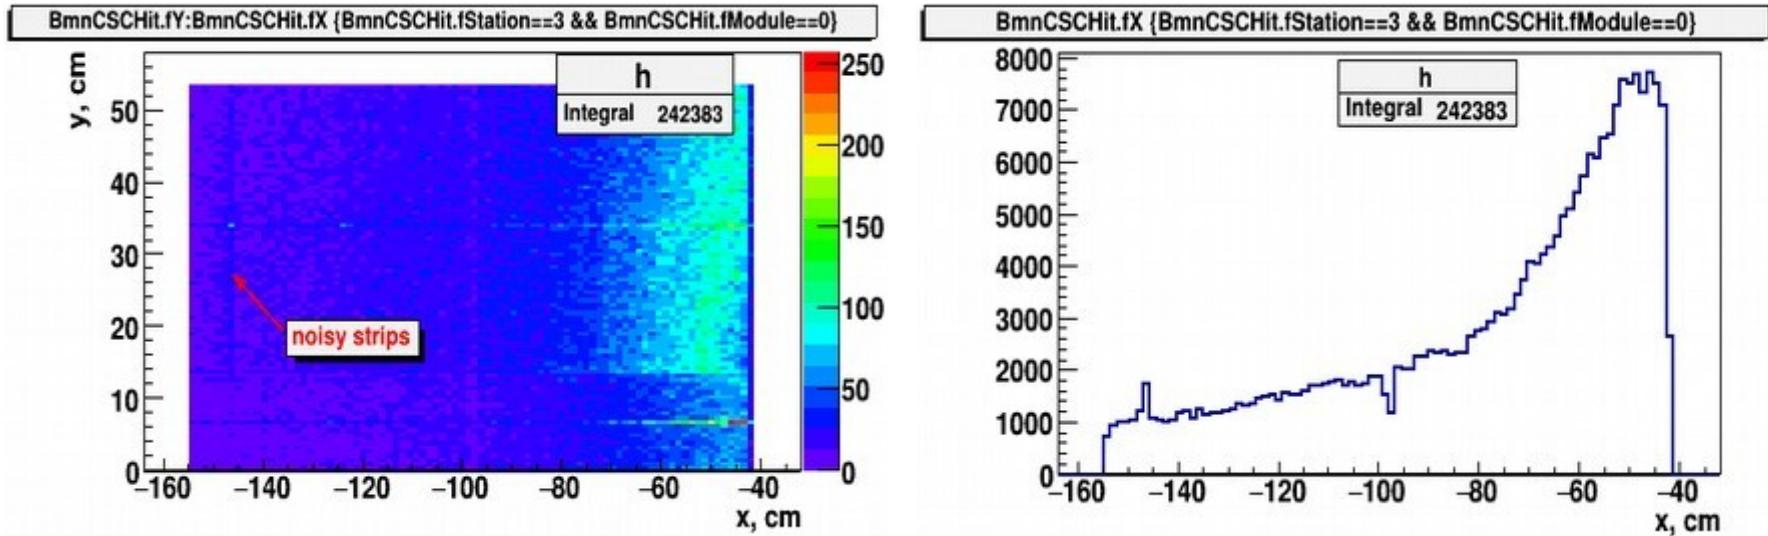

CSC1_0

Noisy strips, high voltage, efficiency drop

Bad zones in CSC3_0

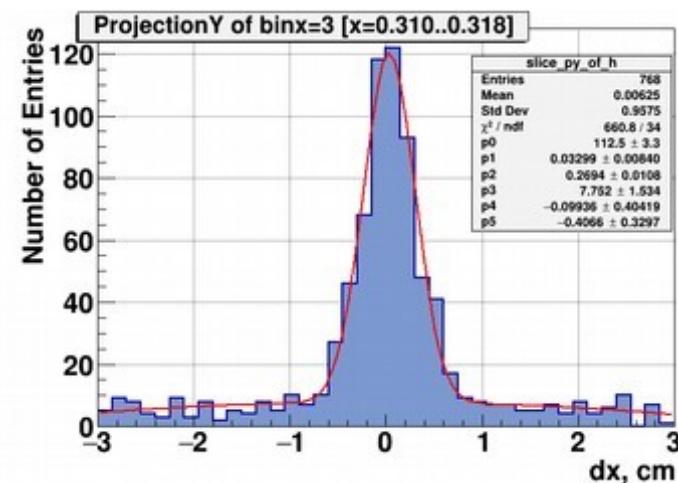

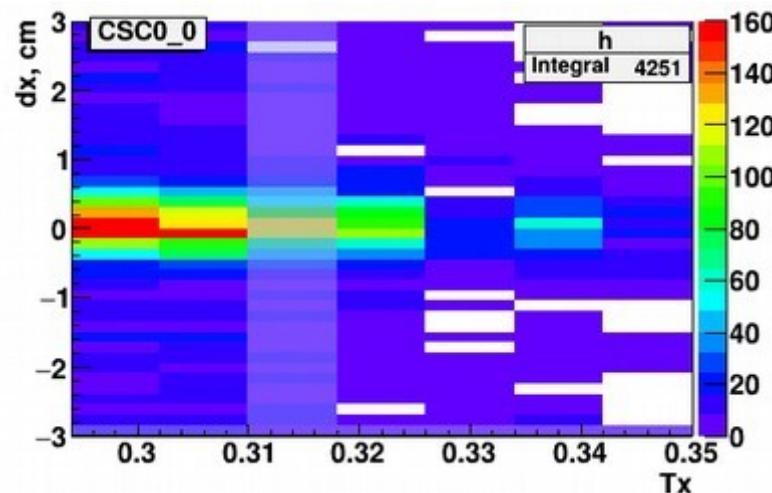

Noisy strips

Matching cuts

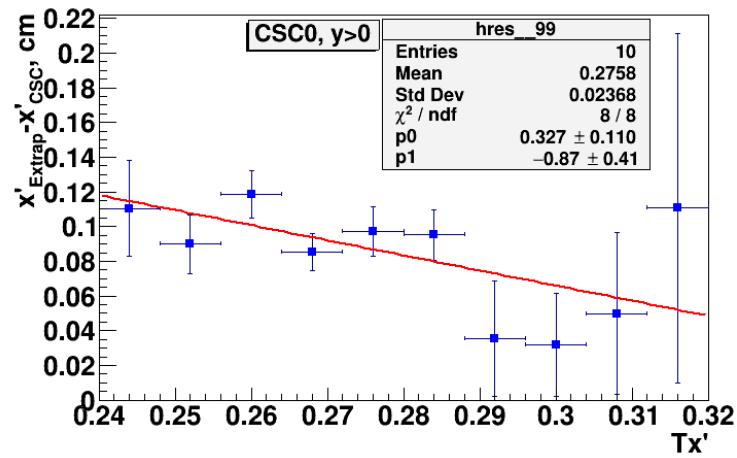

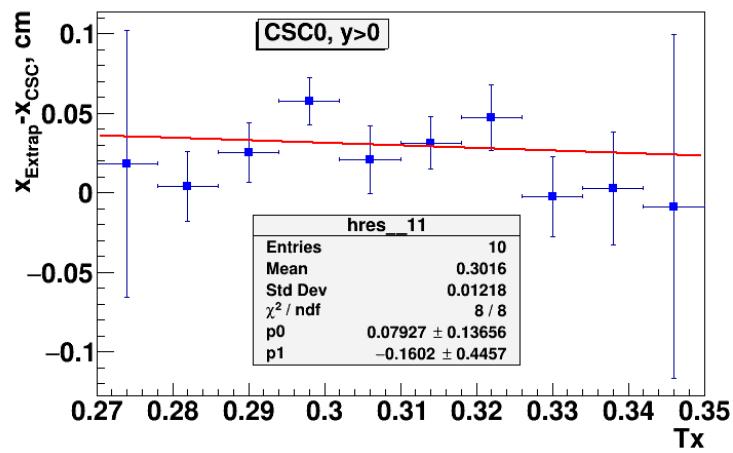

- ✓ NHits > 7
- ✓ NGemHits > 5
- ✓ $|\Delta_{X(Y)\text{ToF-400Hit-Track}}| < 6 \text{ cm}$
- ✓ $|\Delta_{X(Y)\text{CSCHit-Track}}| < 3 \text{ cm}$ (all CSC hits)

Z shift

1. Small CSCs are already well aligned. Worst alignment for CSC0;
2. Between the top and bottom modules in each CSC chamber, the Z shift of about 1.5 cm is obtained;
3. For all modules except CSC0_1, the displacements dz obtained for X and X' coincided within the limits of uncertainty;
4. The maximum dz was obtained for CSC0_1. It was about 3 cm;
5. For all modules, the shifts in X and Y do not exceed 3 mm, with the exception of the CSC2_0 and CSC3_0 modules. $dy_{CSC2_0} \approx -0.44$ cm and $dx_{CSC3_0} \approx 0.34$ cm.

$$dx = \partial dx / \partial T_x$$

$$dz = (x - x_0) \sin\alpha$$

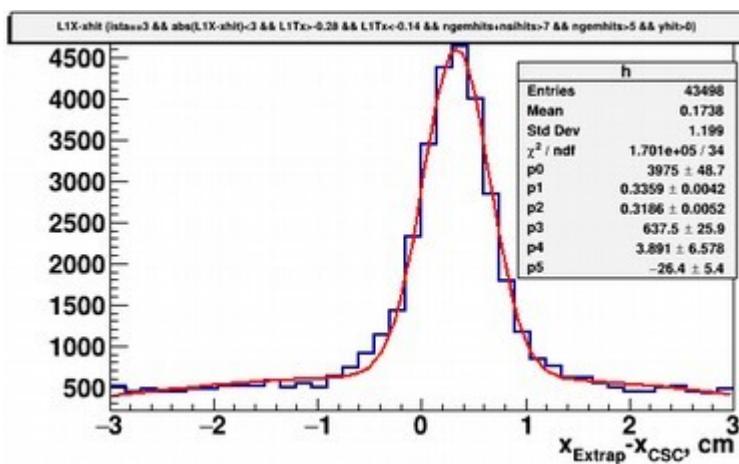

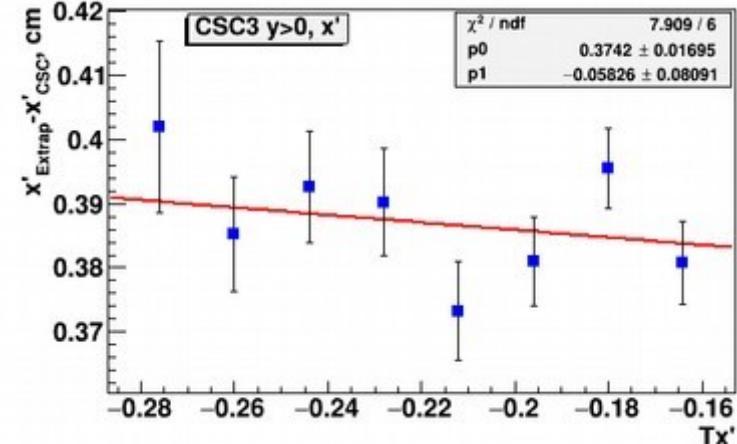

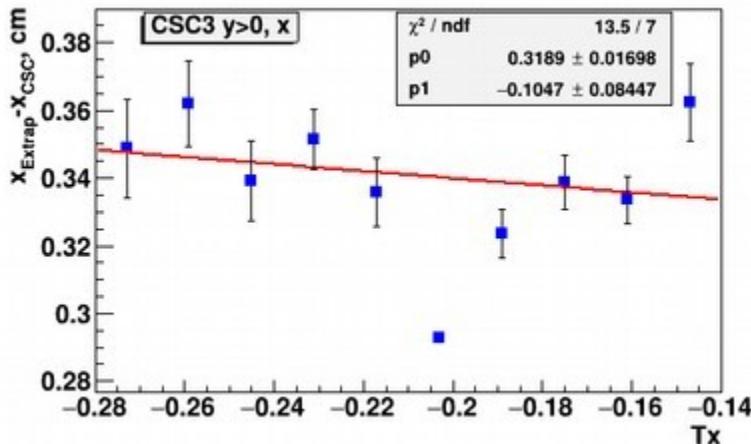

$$x = T_x \cdot z_{CSC3}$$

$$dx = z_{CSC3} \cdot \sin\alpha (T_x^3/3 - T_{x_0} T_x^2/2) + [p2]$$
