

The 8th International Conference "Distributed Computing and
Grid-technologies in Science and Education" (GRID 2018)

Contribution ID: 259

Type: **Sectional reports**

Using extended reality technologies in distributed computer systems

Monday, 10 September 2018 15:30 (15 minutes)

Over the past few decades, web technologies have proven to be a fast, convenient and easy-to-access tool for retrieving information and sharing a large amount of heterogeneous data. The technologies used there, and in particular the HTML technology - have played a major role in the development of the Internet as it is. This is all due to the standardization and creation of a single tool to create network content.

The goal of this work is to create a standard and a language for developing extended reality applications and interfaces built into existing applications. With this language, developers who are familiar with web technologies can quickly and with minimal effort move on to new technology and fill it with content, the lack of which is now the main problem of all extended reality technologies. With usage of the developed system it will be possible to combine the formed community of web developers and perspective technology on the basis of a standardized set of tools that will positively affect both developers and the pace of technology development.

In the future that technology can be used in different spheres, like education, business, advertisement, etc. Also it can be used in global distributed computer systems, what will give an ability to make a global network of virtual objects referred to real-life points.

Primary author: Ms VOZDVIZHENS KAYA, Nadezhda (Dubna State University)

Presenter: Ms VOZDVIZHENS KAYA, Nadezhda (Dubna State University)

Session Classification: Scientific, industry and business applications in distributed computing systems, education

Track Classification: 4. Scientific, industry and business applications in distributed computing systems
