

# Progres of Task 3 : Estimation of secondary particles contribution in the yields of (anti)protons and deuterons

MÁRQUEZ RAMÍREZ JUAN CARLOS  
FRIDAY, 12TH APRIL 2024

# Objectives

- Born in A+A collision primary particles interact inside MPD detector material producing secondaries.
  - Some of them can be rejected by track selection criteria, some – cannot!
  - One must estimate contribution of secondaries in selected samples of (anti)protons and deuterons.
- 

# With DCA

```

66 // DCA: Distance of Closest Approach perpendicular and along Z axis
67 float GetDCAX() const { return fDCAX; }
68 float GetDCAY() const { return fDCAY; }
69 float GetDCAZ() const { return fDCAZ; }
70 float GetDCAZ1() const { return fDCAZ1; }

```

I make the histograms with DCA, & I used this datas.

Where DCA : Distance of Closest Approach perpendicular and along Z axis

# Conclusiones

By taking the ratio between the primary and secondary particles with respect to the total particles, it allowed us to see the percentage with the regions where there is greater contamination. Telling us in interval where
