

Dependence of momentum resolution on straw tracker spatial resolution

Ruslan Akhunzyanov

Spatial resolution of straw tracker σ_R

- Until recently (and still in the master branch), in SpdRoot σ_R was constant, with default value **150** μm .
- In this report I consider other options for σ_R :
 - $\sigma_R = f(R)$ — based on Artem Chukanov's talk at the last SPD Collaboration Meeting;
 - $\sigma_R = \text{const} = 200, 250, 300, 350 \mu\text{m}$.

σ_R as a function of R

$$\sigma_R(R) = 0.6506 \exp(-0.326 R)$$

(here all values in mm)

Plot and parameterization
by Artem Chukanov.

Implementation of $\sigma_R(R)$ in SpdRoot

σ_R as a function $f(R)$ of drift radius R has been implemented in SpdRoot: necessary changes have been applied to class SpdTsmCHitProducer.

Committed to the development branch on June 07, 2024.

Type of $f(R)$ and its parameters may be changed in reco script by user via methods:

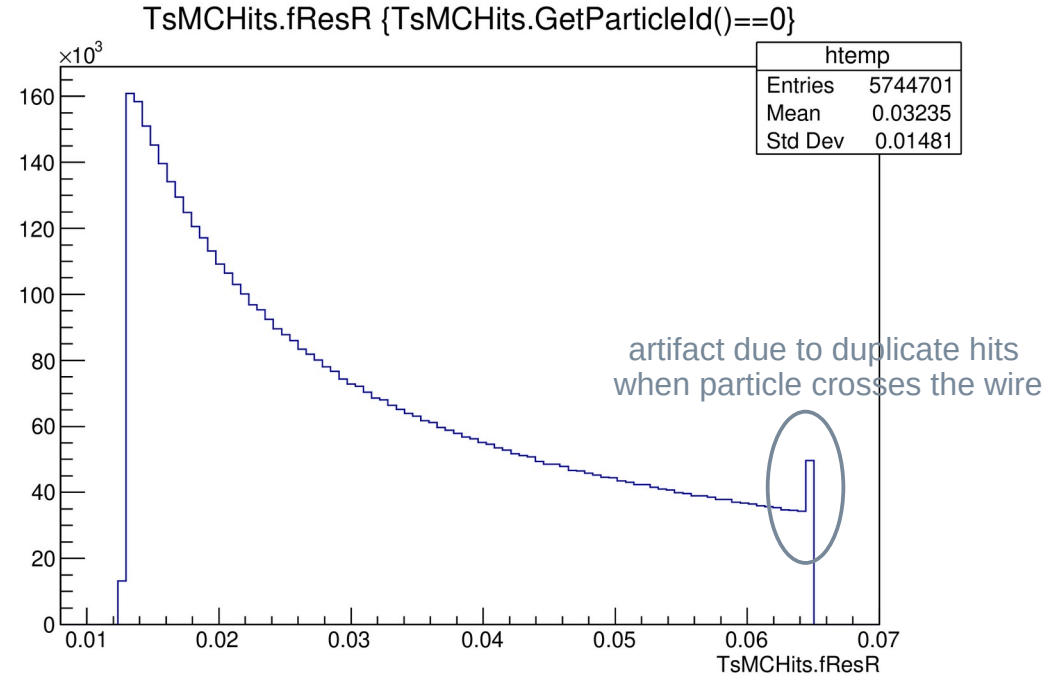

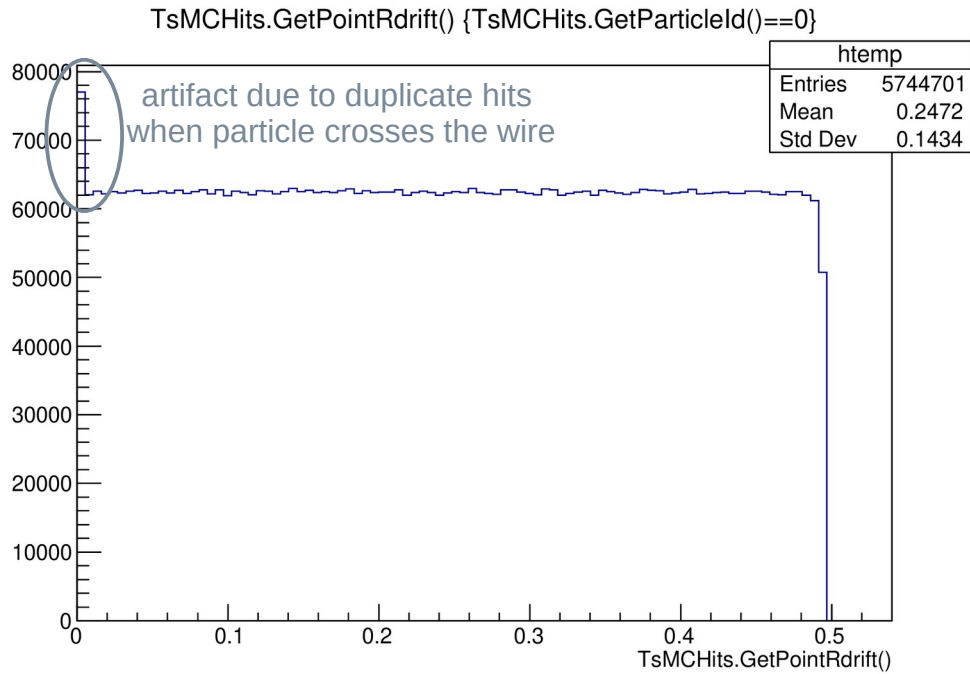

```
SpdTsmCHitProducer::SetHitResolutionRFunctionParameters(Int_t funcType,  
const std::vector<Double_t>& par)
```

or

```
SpdTsmCHitProducer::SetHitResolutionRFunction(Int_t funcType)
```

| funcType | $f(R)$ | default parameters |
|-------------|---|--|
| 0 (default) | $\text{par}[0] * \exp(\text{par}[1] * R)$ | $\text{par}[0] = 0.06506$ $\text{par}[1] = -3.26$ |
| 1 | $\text{par}[0]$ | $\text{par}[0] = 0.0240$ |

R and σ_R distributions

(plots for an artificial sample $p = 1 \text{ GeV}/c$, $\theta = 90^\circ$, φ uniformly distributed, primary vertex fixed)

$$\langle \sigma \rangle = 323 \mu\text{m}$$

$$\left(\langle \sigma^{-2} \rangle \right)^{-\frac{1}{2}} = 237 \mu\text{m}$$

Momentum resolution σ_p/p at 1 GeV/c

π^+ , $p = 1.0$ GeV/c, $\theta = 90^\circ$, only ST

Momentum resolution σ_p/p at 2 GeV/c

π^+ , $p = 2.0$ GeV/c, $\theta = 90^\circ$, only ST

Mean momentum resolution σ_p/p

$\theta=90^\circ$, only ST

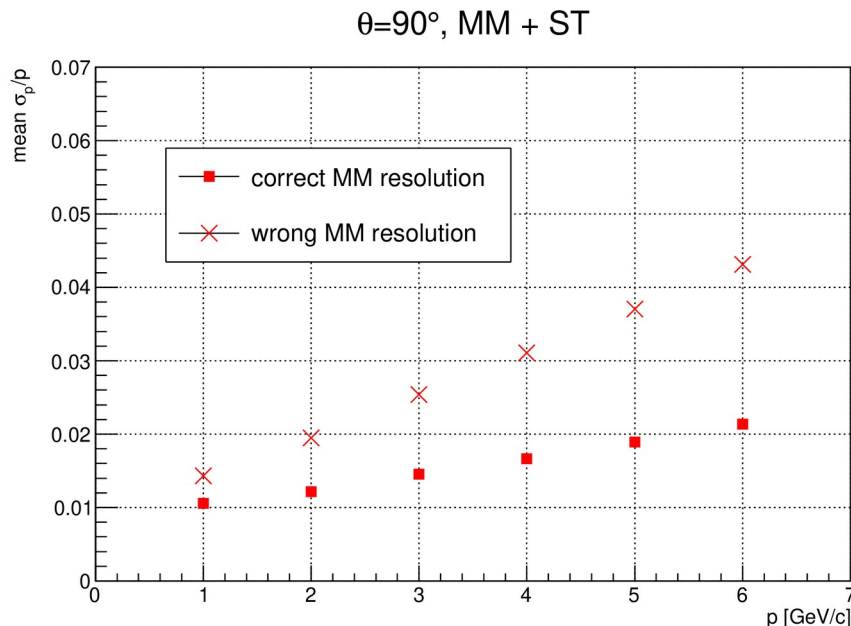

Straw Tracker:
31×2 layers
 σ_R on plot

$$\text{ratio} \rightarrow \frac{240}{150} = 1.6$$

Yet another bug in SpdRoot: Micromegas resolution

- There was a bug inside `SpdMvdMCHitProducer::SetHitResolution(layerId, resU, resV)` method: the `resU` was also used in place of `resV`, (probably, due a typo), while `resV` was ignored.
- So instead of assumed default $\sigma_u = 800 \mu\text{m}$, $\sigma_v = 90 \mu\text{m}$ we got $\sigma_u = \sigma_v = 800 \mu\text{m}$.

- Fix committed to the development branch on June 17, 2024.
- Previous simulations involving Micromegas may be too pessimistic...

Mean momentum resolution σ_p/p

$\theta=90^\circ$, MM + ST

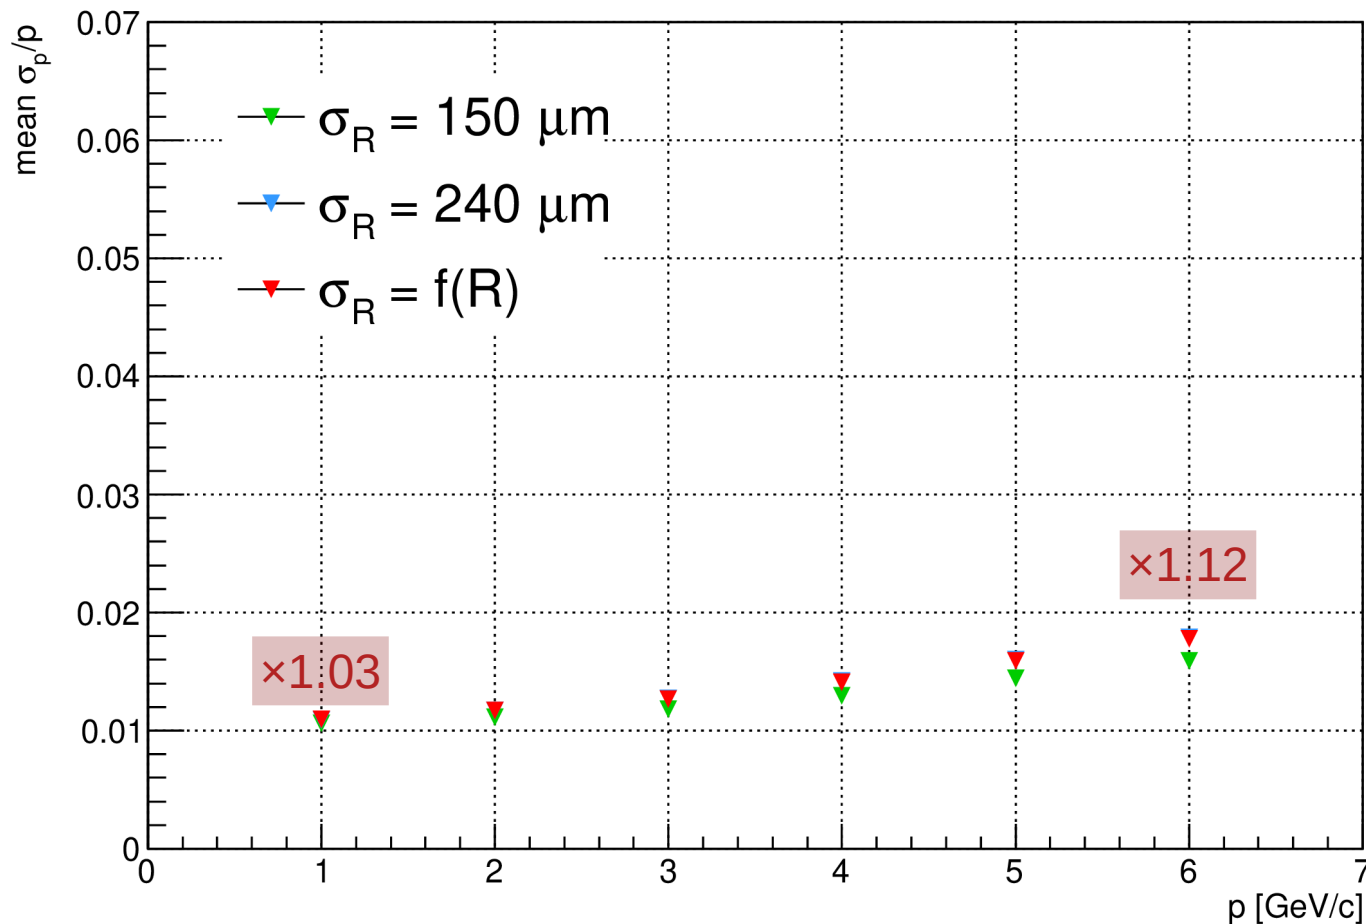

Straw Tracker:
31×2 layers
 σ_R on plot

Micromegas:
1 superlayer
 $\sigma_u = 800 \mu\text{m}$
 $\sigma_v = 90 \mu\text{m}$

Mean momentum resolution σ_p/p

$\theta=90^\circ$, DSSD + ST

Straw Tracker:
31×2 layers
 σ_R on plot

DSSD:
3 layers
 $\sigma_u = 81.3 \mu\text{m}$
 $\sigma_v = 27.4 \mu\text{m}$

Plots for different values of σ_R

Mean momentum resolution σ_p/p

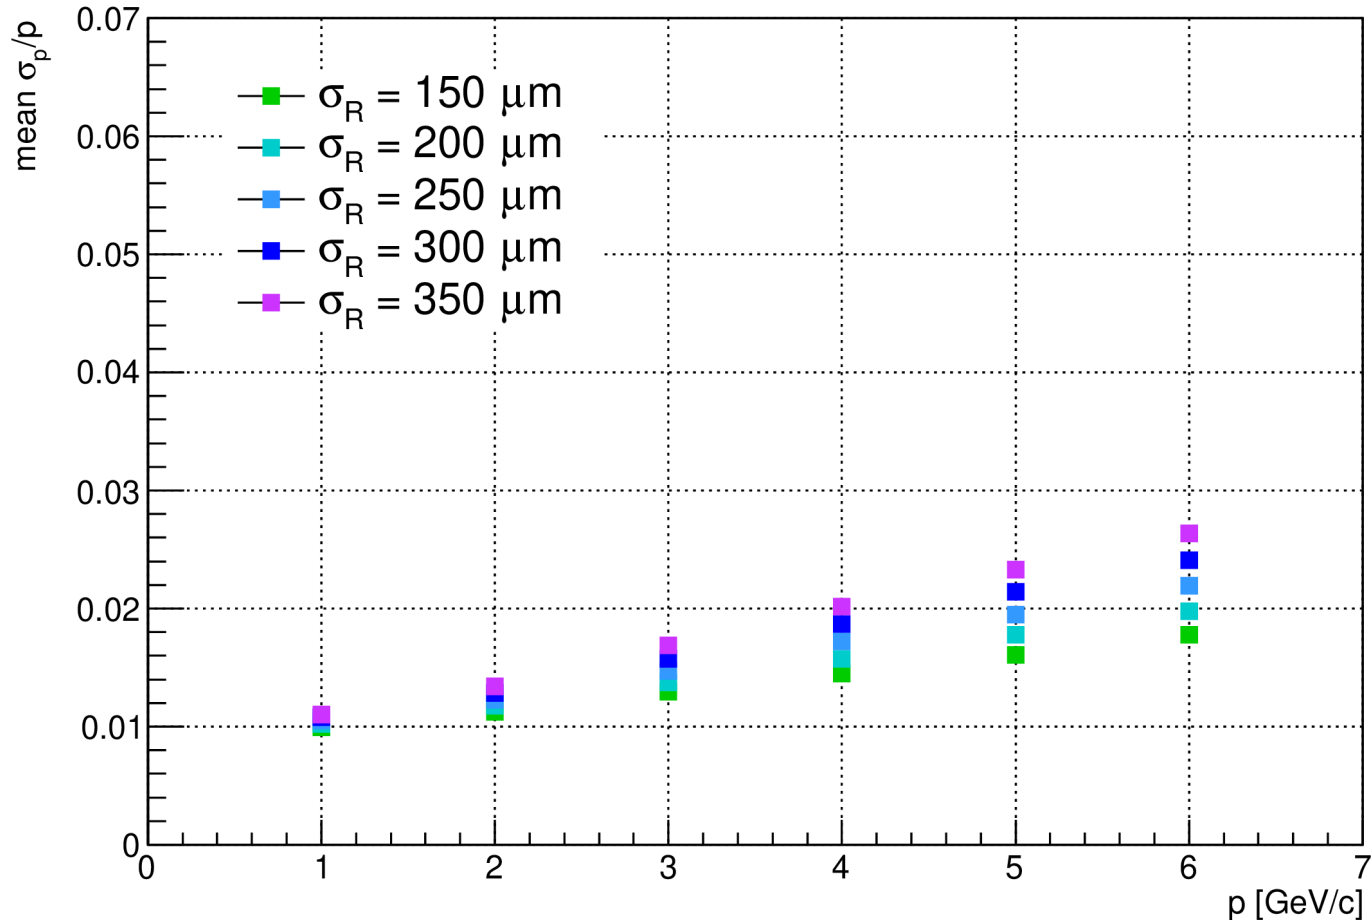

$\theta=90^\circ$, only ST

Straw Tracker:
31×2 layers
 σ_R on plot

Mean momentum resolution σ_p/p

$\theta=90^\circ$, MM + ST

Straw Tracker:
31×2 layers
 σ_R on plot

Micromegas:
1 superlayer
 $\sigma_u = 800 \mu\text{m}$
 $\sigma_v = 90 \mu\text{m}$

Mean momentum resolution σ_p/p

$\theta=90^\circ$, DSSD + ST

Straw Tracker:
31×2 layers
 σ_R on plot

DSSD:
3 layers
 $\sigma_u = 81.3 \mu\text{m}$
 $\sigma_v = 27.4 \mu\text{m}$

Conclusions

- Spatial resolution of straw tube σ_R as a function of drift distance R has been implemented in SpdRoot.
- Effective σ_R of our straw tubes is about **240 μm** .
