

Reconstruction of Σ^0 hyperons at the MPD Experiment

Yulin Wang (王玉林)
Shandong University
MPD Collaboration

Outline

- **Motivation**
- **Dataset**
- **Photon Reconstruction**
- **Λ Reconstruction**
- **Σ^0 Reconstruction**
- **Summary**

Motivation

Phase diagram

MPD detector

The main purpose of the MPD experiment is to search for the first order phase transition and the critical end-point

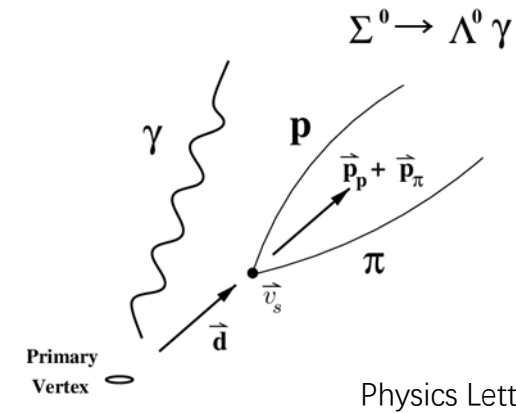

Hyperons production in heavy-ion collisions is important for addressing many open questions

$\Sigma^0 \rightarrow \Lambda + \gamma$ ($BR \approx 100\%$):

$$M_{\Sigma^0} = 1192.642 \pm 0.024 \text{ MeV}$$

$$\tau_{\Sigma^0} = 7.4 \pm 0.7 \times 10^{-20} \text{ s}$$

- Study of strangeness production mechanisms
- Feed-down contribution to Λ and photon spectrum
- As a reference to tune the event generators and models

Physics Letters B 479 (2000)

Dataset

- Collision system: Bi+Bi@9.2 GeV
- Event generator: UrQMD
- Production: 50M events <https://mpdforum.jinr.ru/t/request-25-general-purpose-50m-urqmd-bibi-9-2-second-collaboration-paper/455> + 15M events <https://mpdforum.jinr.ru/t/request-34-general-purpose-15m-urqmd-bibi-9-2-dielectron-enhanced/618>
- Analysis Train (Wagon - pairGLambda): <https://mpdforum.jinr.ru/t/request-12-input-request-25-request-34/682>
- Event cut: Primary vertex of event reconstructed and vertex_z cut < 100 cm

Photon Reconstruction

The photon from the Σ^0 is very soft (low energy) due to the small mass difference between Σ^0 and Λ ($m_{\Sigma^0} - m_{\Lambda} \approx 77$ MeV).

Energy resolution of the TPC is better than that of ECal at low energy.

The best way would be to reconstruct photons from photon conversion: $\gamma^* \rightarrow e^+e^-$.

Momentum resolution

Energy resolution

Photon conversion [arXiv:1907.08893](https://arxiv.org/abs/1907.08893)

Photon Conversion

Photon will convert into a positron-electron pair when it interacts with the materials in the detectors, the probability of photon conversion strongly depends on the material budget

Conversion pairs

Beam pipe: $r = 4 \text{ cm}$

TPC inner structures : $r = 27 \text{ cm}$

Conversion probability

Only about 2% photon conversion can be detected

Photon Reconstruction

Photon reconstruction by photon conversion:

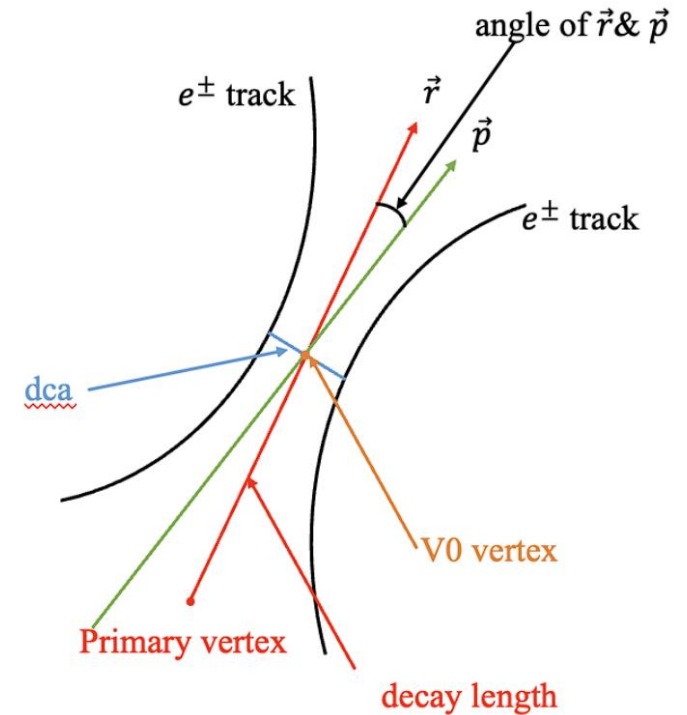

$$\gamma^* \rightarrow e^+ e^-$$

Electron identification by TPC and TOF:

- $n_{hits} > 10$
- $p_T > 0.05 \text{ GeV}/c$
- $n\sigma_{el}^{tpc} < 3.0$
- $n\sigma_{el}^{tof} < 3.0$ (if TOF Match)

Pair's variables:

- dca: distance of closest approach for $e^+ e^-$ tracks
- Chi2: quality of the secondary vertex reconstruction
- angle: between \vec{r} & \vec{p}
- decay length: the distance from primary vertex to V0 vertex
- mass: the mass of mother particle of $e^+ e^-$ pair

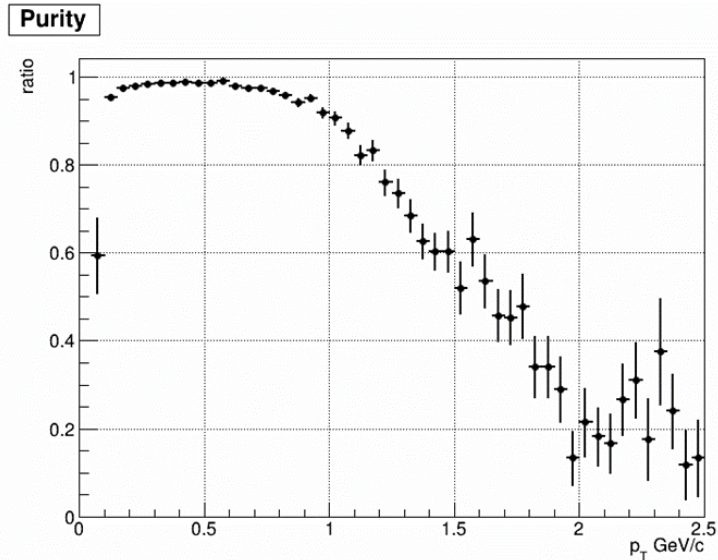

Topological structure of photon conversion

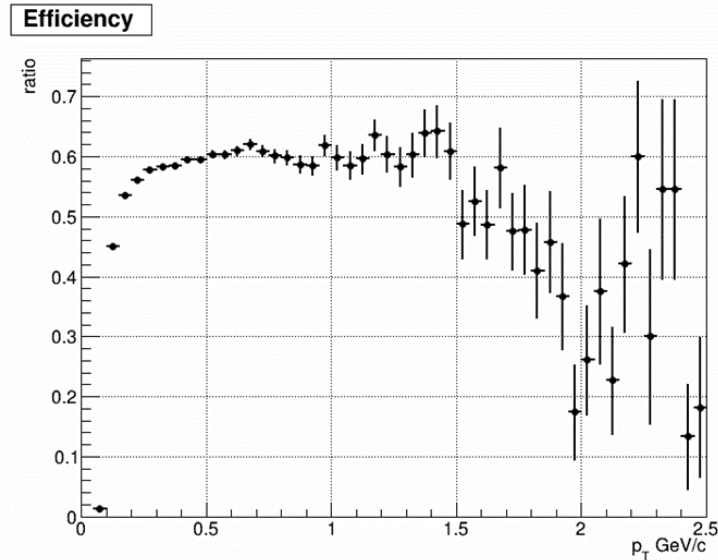

Photon Reconstruction

The black dotted curves as selection, which a range accounts for 90% of photon in the total signal.

$$\text{Purity} = \frac{N_{\text{True pairs after cut}}}{N_{\text{All pairs after cut}}}$$

$$\text{Efficiency} = \frac{N_{\text{True pairs after cut}}}{N_{\text{True pairs before cut}}}$$

The purity of photons was large than 90% at $0.1 < p_T < 1.0$ GeV/c

Λ Reconstruction

Λ reconstruction by the decay channel with BR \approx 64.1%:

p and π^- are selected by the TPC and TOF.

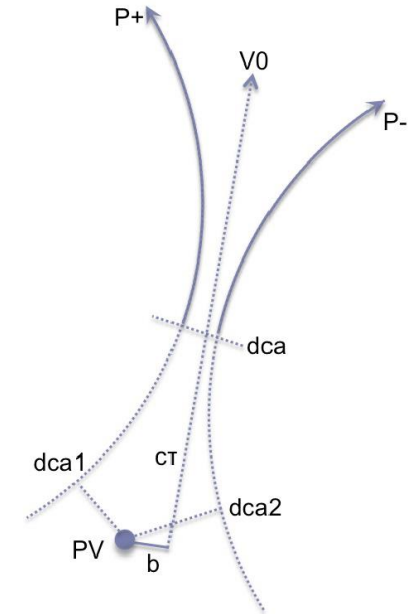

- $n_{hits} > 24$
- $p_T > 0.1$ GeV/c

proton:

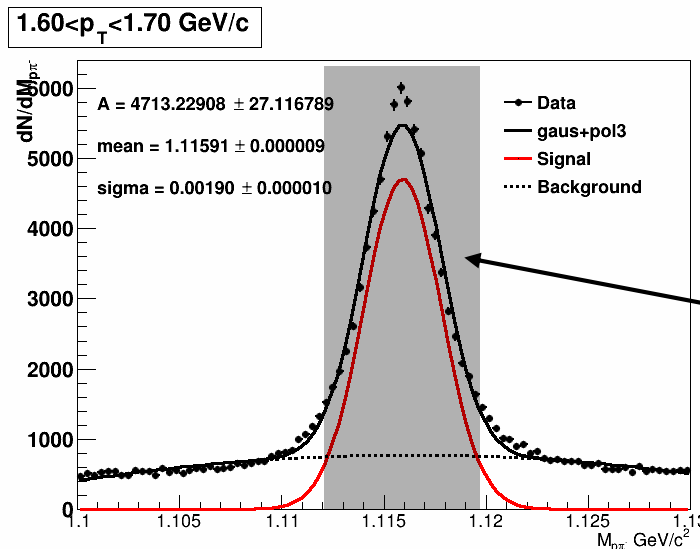

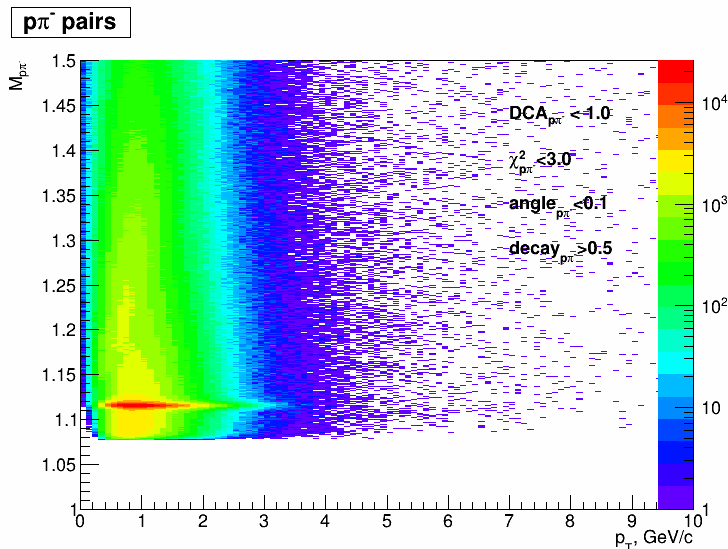

- $n\sigma_p^{tpc} < 3.0$
- $n\sigma_p^{tof} < 3.0$ (if TOF Match)
- $\chi_p^2 > 3.0$

π^- :

- $n\sigma_{\pi^-}^{tpc} < 3.0$
- $n\sigma_{\pi^-}^{tof} < 3.0$ (if TOF Match)
- $\chi_{\pi^-}^2 > 7.0$

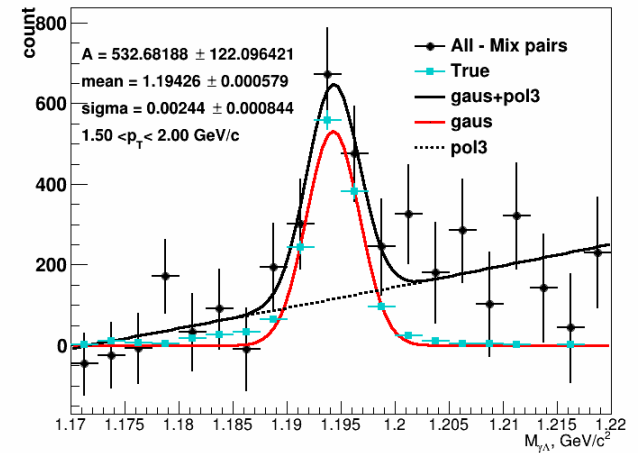

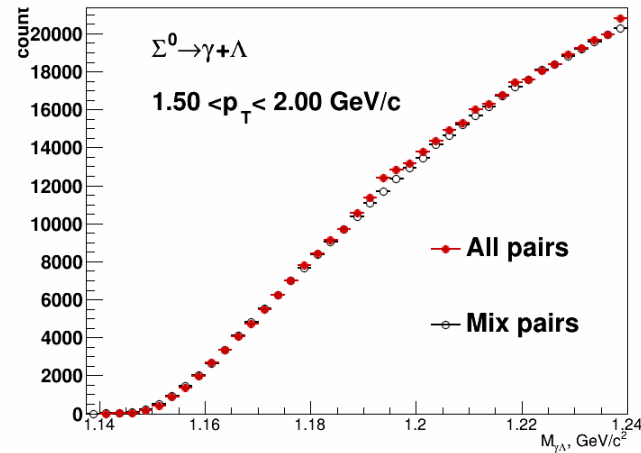

Topological structure of Λ decay

$|M_{p\pi^-} - M_{pdg\Lambda}| < 2 * \sigma_{\Lambda}$ as Λ for reconstruction of Σ^0

Σ^0 Reconstruction

$\gamma(\text{PCM})+\Lambda$ pairs

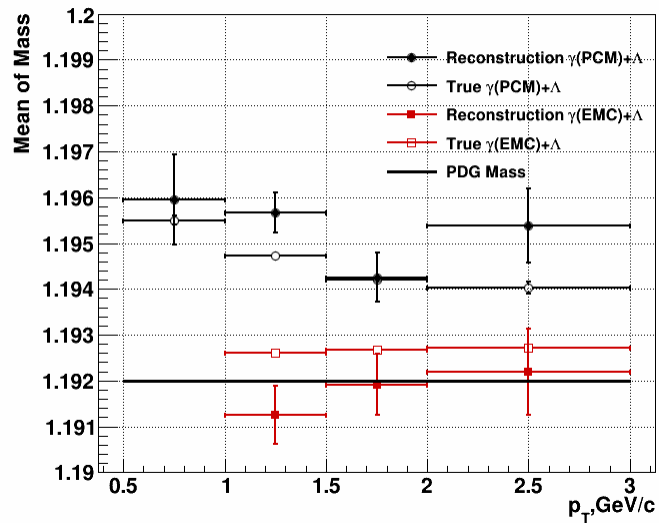

$\gamma(\text{EMC})+\Lambda$ pairs

The width of Σ^0 reconstruction by EMC method was large than PCM method

The EMC method had many backgrounds that cannot be extracted by mix events

Σ^0 Reconstruction

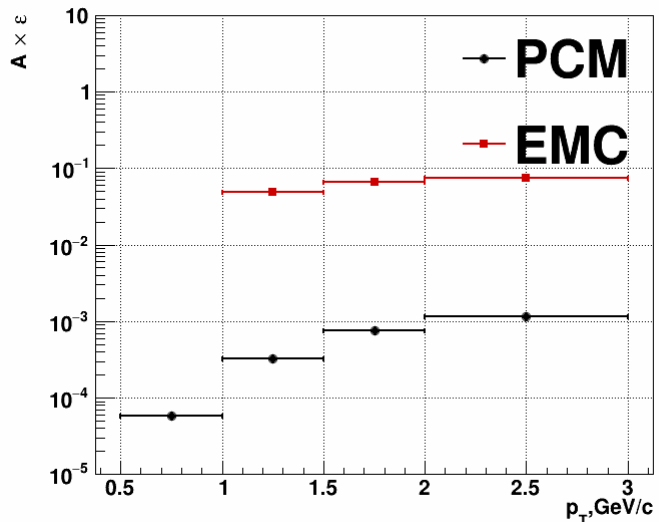

Invariant mass

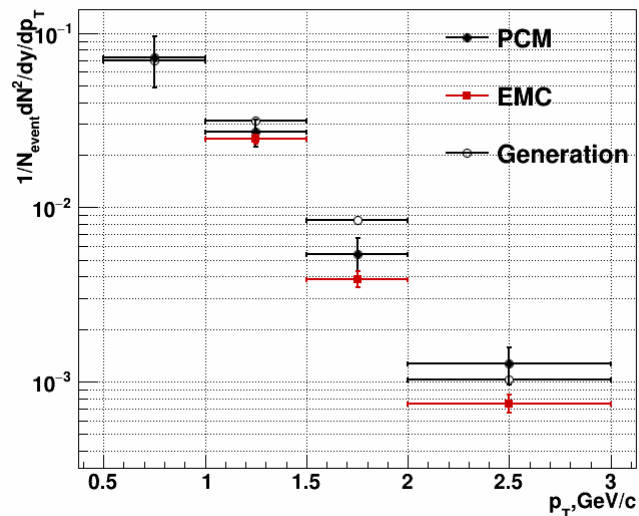

Width

Raw Yield

Efficiency

Yield

Measurements for Σ^0 are possible starting from $p_T \sim 500$ MeV/c in rapidity range $|y| < 0.5$

The fit mean of mass are large than the pdg mass of Σ^0 reconstruction by PCM method

The yields obtained for Σ^0 are not completely consistent with the truly

Summary

- **First observation of Σ^0 for the MPD:**
 - **Photons reconstruction by photon conversion method has high purity**
 - **Lambdas selection was rough and need to improve selections**
- **Signals for Σ^0 are observed in $0.5 < p_T < 3.0$ GeV/c**
- **The first-look results of yields for reconstructed of Σ^0 are not completely consistent with the generated spectra, work in progress**

Next to do:

- **Fine tuning of fits is still required**
- **Improve Lambdas and Photons selections to provide better significance and coverage**

Photon

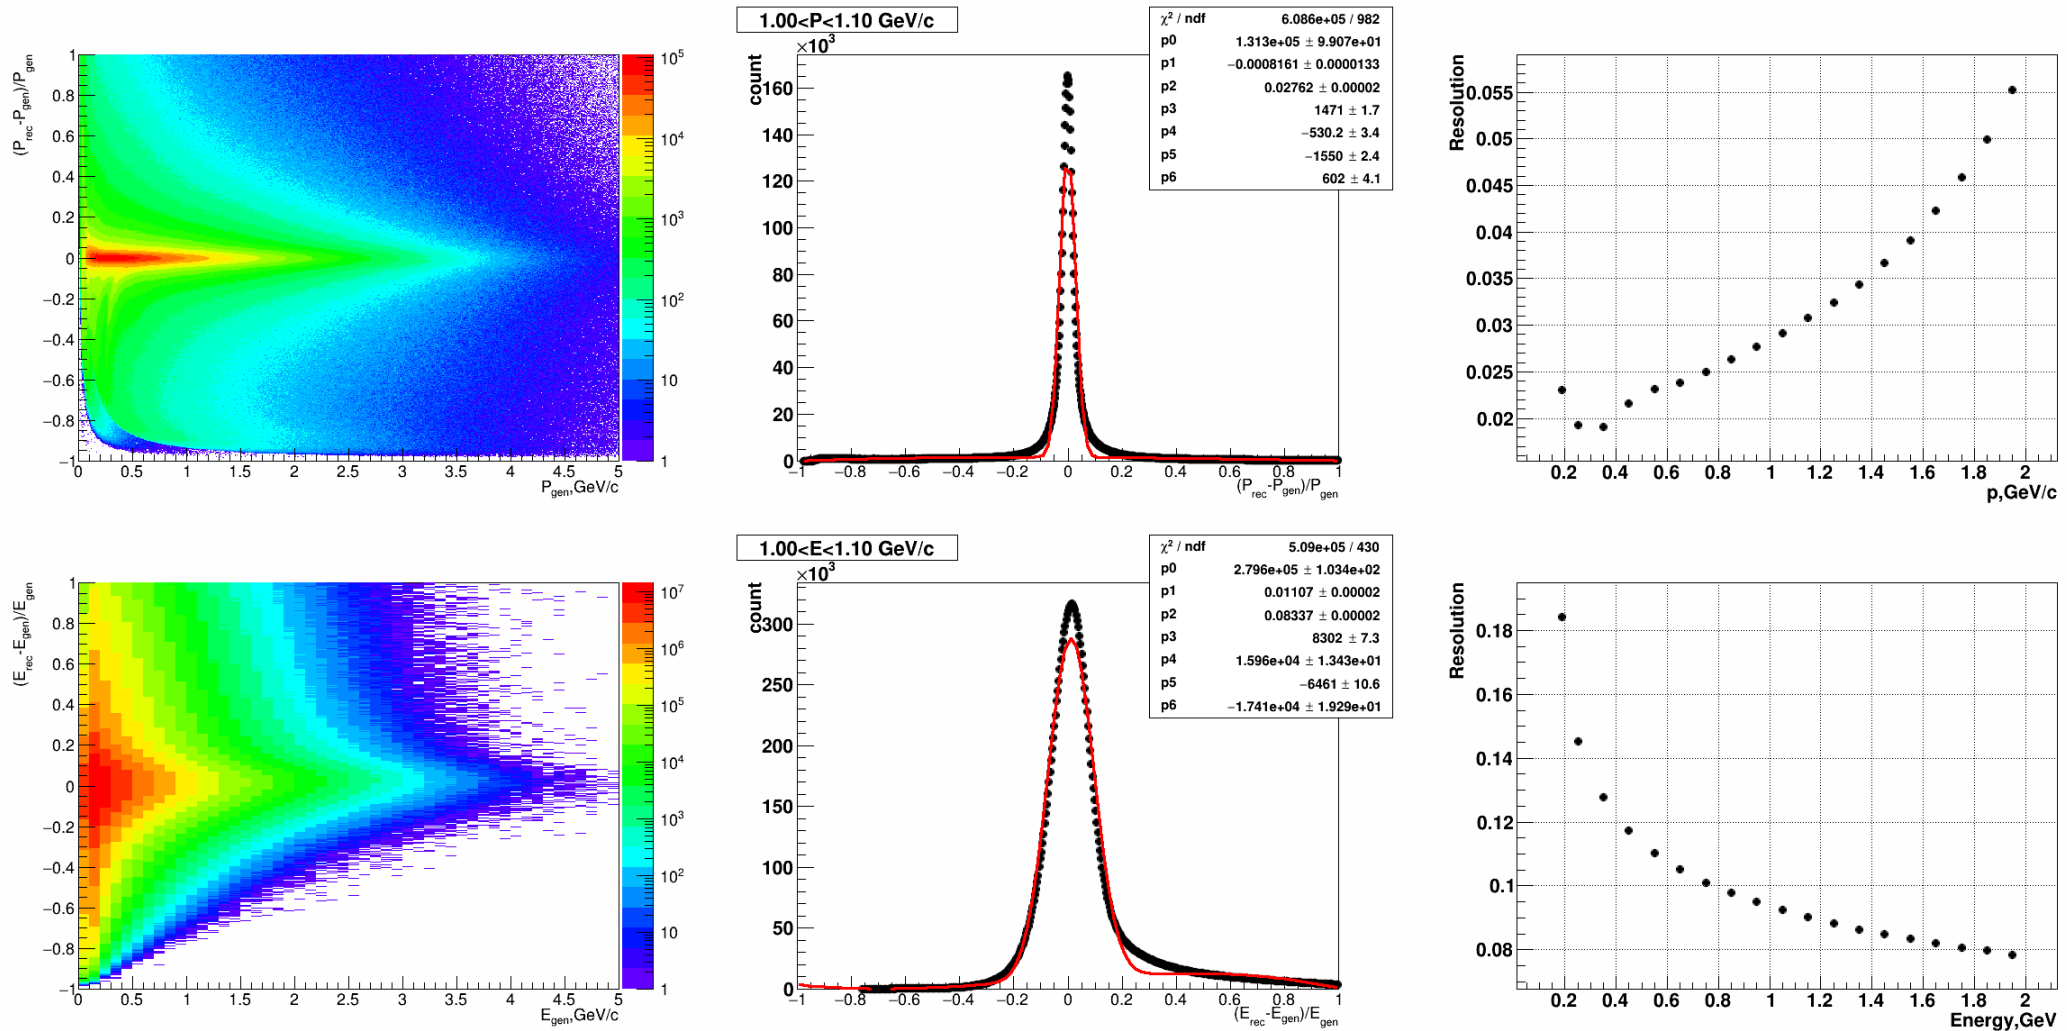

- MC_{γ} : γ from MCStack
- $MC_{\gamma \rightarrow e^+e^-}$: $\gamma \rightarrow e^+e^-$ from MCStack
- $Reconstruction_{\gamma \rightarrow e^+e^-}$: $\gamma \rightarrow e^+e^-$ from MpdTpcKalmanTrack
- $MC\ Reconstruction_{\gamma \rightarrow e^+e^-}$: $\gamma \rightarrow e^+e^-$ from MpdTpcKalmanTrack, p_T from MCStack

The track used in reconstruction was primary track, so the momentum of e^+e^- pairs was not right

- All: $P = \frac{N_{MC\ Reconstruction}(\gamma \rightarrow e^+e^-)}{N_{MC}(\gamma \rightarrow e^+e^-)}$
- Conversion: $P = \frac{N_{MC}(\gamma \rightarrow e^+e^-)}{N_{MC\ \gamma}}$
- Reconstruction: $P = \frac{N_{MC\ Reconstruction}(\gamma \rightarrow e^+e^-)}{N_{MC}(\gamma \rightarrow e^+e^-)}$

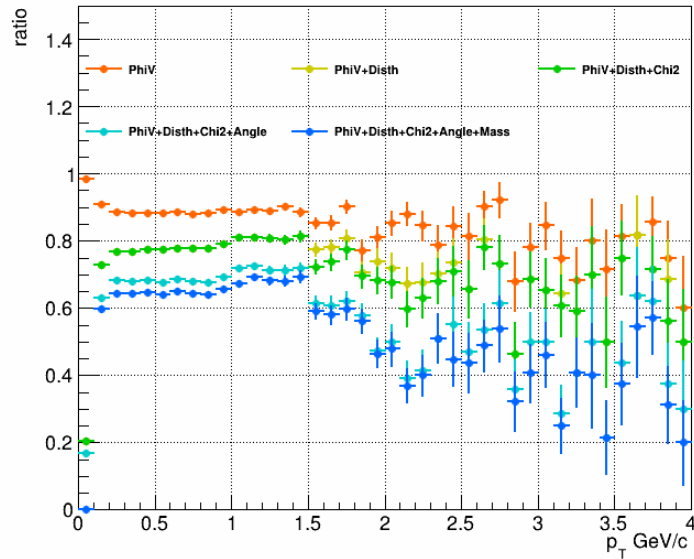

Resolution

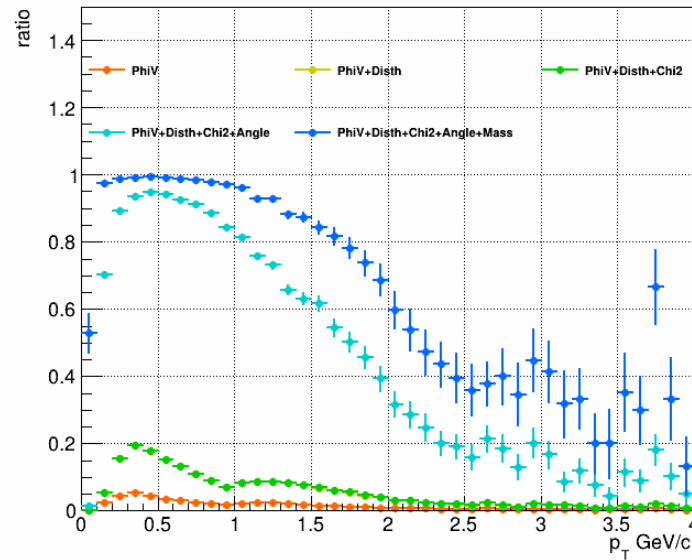

Fit different $P(E)$ bins $(P_{rec} - P_{gen})/P_{rec}$ ($(E_{rec} - E_{gen})/E_{rec}$) distribution by a Gaussian function, the Gaussian fitted sigma as a resolution.

Efficiency and purity

Efficiency

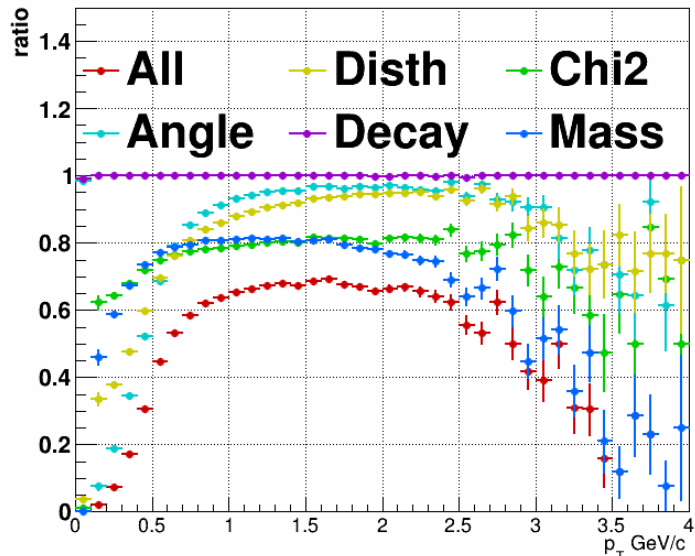

Purity

- $\Phi < 1.0\sigma_{\Phi}$
- $Disth < 1.0\sigma_{disth}$
- $\chi^2 < 1.0\sigma_{\chi^2}$ & $p_T > 1.5$
- $angle < 1.0\sigma_{angle}$
- $Mass < 1.0\sigma_{Mass}$

Efficiency of Λ reconstruction

Purity of Λ reconstruction

- Dist: $dist < 1.0$
- Chi2: $\chi^2_{\Lambda} < 3.0$
- Angle : $angle < 0.1$
- Decay: $decay > 0.5$
- Mass: $|M_{p\pi^-} - M_{\Lambda}| < 0.004$

EMC Photon

Efficiency

Purity

- Chi2: $\chi^2 < 4$
- Time: $T_{cl} < 2$
- Match1: $dphi < 10$ && $dz < 10$
- Match2:

$$\frac{dz^2}{7.5^2} + \frac{dphi^2}{7.5^2} > 4$$

- Lambda:

$$\left(\frac{\lambda_{short} - 1.4}{0.9} \right)^2 + \left(\frac{\lambda_{long} - 2.5}{1} \right)^2 < 1$$
