

# Online software for Baikal-GVD

**E.N. Pliskovsky**

**on behalf of the Baikal-GVD collaboration**

Joint Institute for Nuclear Research, Dubna, Russia, 141980

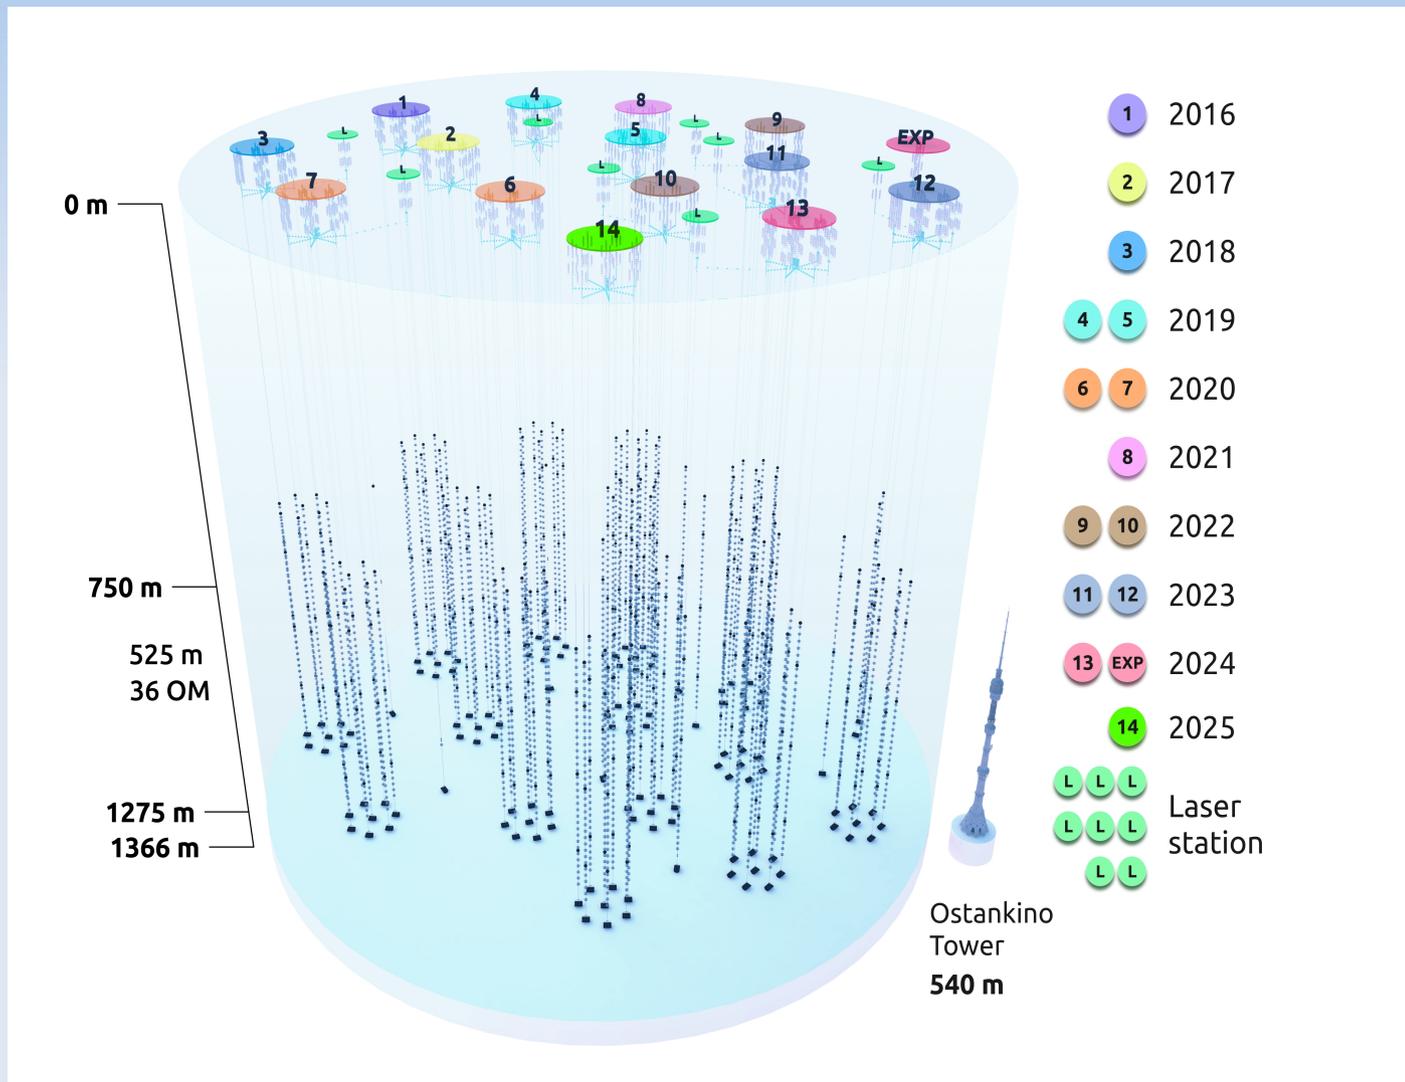

GRID'2025 Computing for MegaScience Projects 10.07.2025

# Detector Status

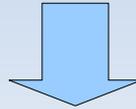

- 4212 Optical modules on 117 strings (14 out of 20 clusters)
- 8 or 9 strings form a cluster - independent array of optical modules
- 36 optical modules per string
- 60 m between strings in a cluster, 250-300 m between clusters
- More than 0.7 km<sup>3</sup> of water volume
- More than 400 acoustic modules for positioning
- LED modules and powerful laser sources for calibration
- Each cluster operates in its own subnet

# Key features & principles

- Remote location of the detector (~100 km from Irkutsk), no backbone communication lines
- The detector is operated by one person
- Physical inaccessibility of the detector components from mid April to mid February
- Data transmission system : max 50 Mbit/cluster, 5.6 Mbit from string

## **Key Principles for DAQ Software**

Ensuring easy maintenance of the detector

Reliability of hardware and software

Autonomous operation in the absence of Internet connections

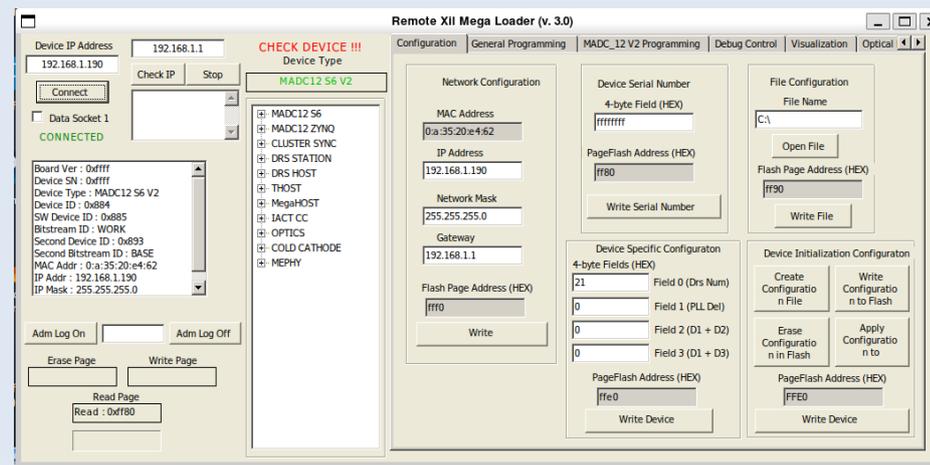

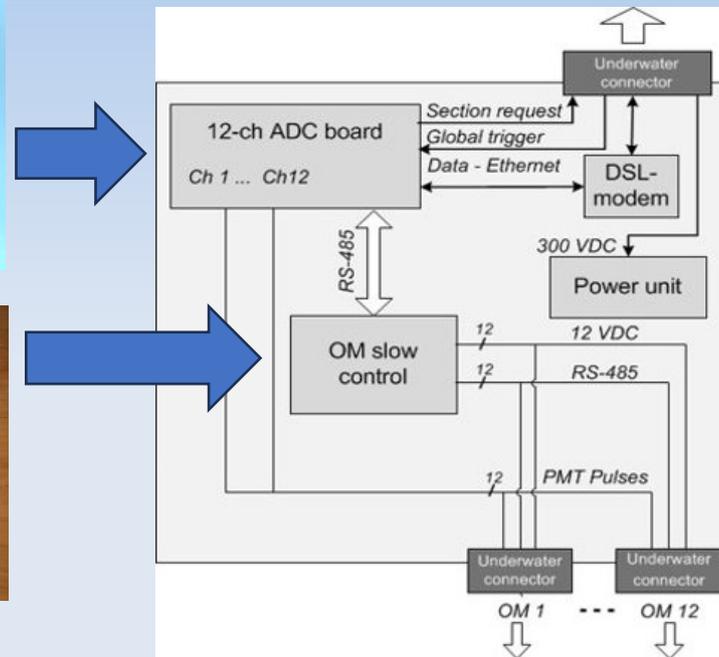

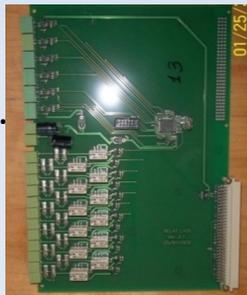

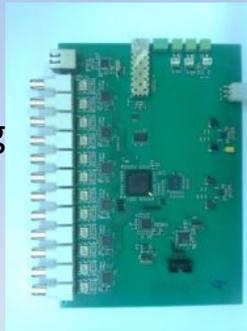

## **Detector as IT-infrastructure**

- > 4000 microcontrollers in OM's - RS-485
- > 350 microcomputers - TCP IP
- > 1000 MOXA network hardware components (switches, DSL, Nports) – TCP IP
- + I2C sensors (humidity, pressure, temperature.....)
- + fiber-optic cable to shore, slow DSL connections within a cluster

# Section (as base DAQ cell)

- **12-channel ADC unit (master)** : PMTs analog pulse conversion, time synchronization, data processing, local trigger.
  - Xilinx Spartan 6 & Zync
  - base && work firmware
- **Data transmission** : Two outputs of ADC board: optical output (for future detector extension) and 100 BASE-TX (present stage).
- **shDSL modem** : Extending the Ethernet line up to 1 km.
- **Slow control board (relay)** : OM power on/off and control of OM operation (RS485).

# Online Software : Overview

## Master (muon) data taking :

Main Program

## Service software :

Acoustic data taking software  
U/W Lasers control utilites  
White-Rabbit (time sync) utilites  
Low-level Master & FADC utilite  
Power management program

## Monitoring software :

Dashboards, web-based monitors  
Commutators & shore power boxes monitoring  
OM monitoring software  
Influx DB, MySQL DB

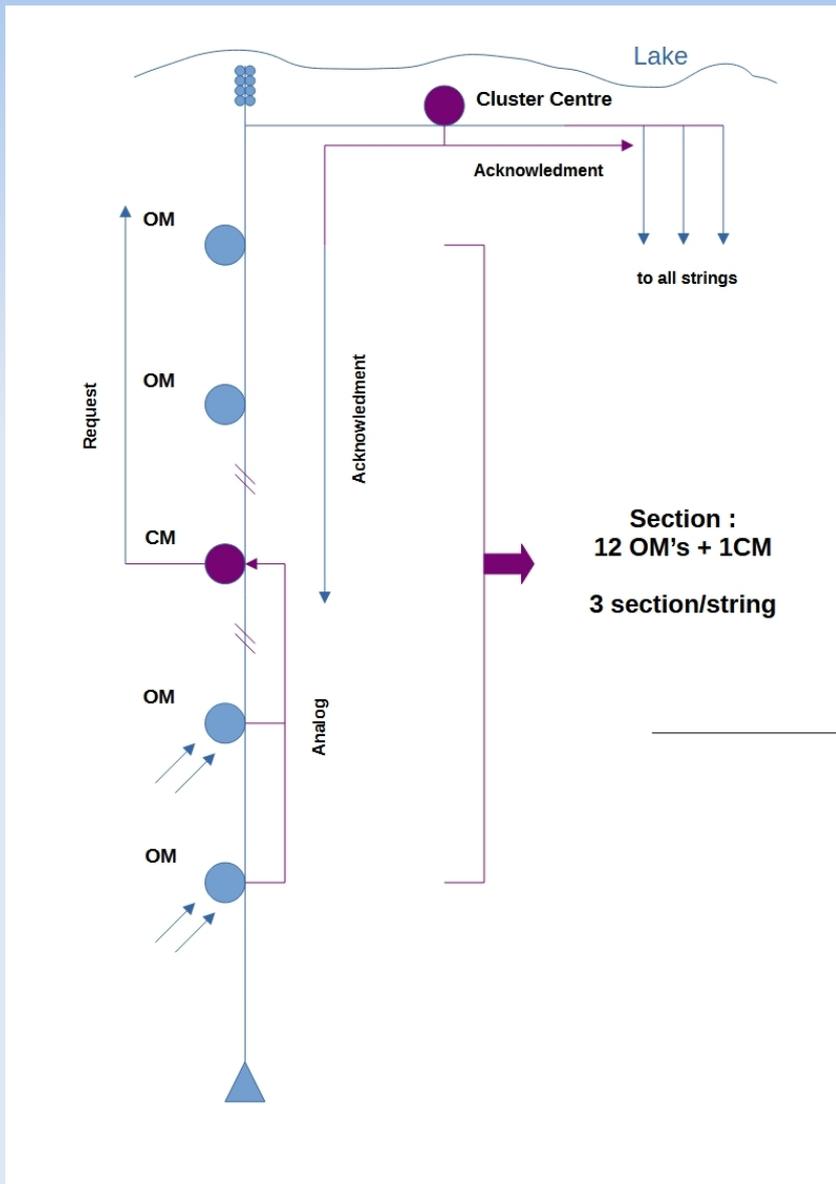

Linux (debian)  
C/C++, Qt, Python  
Shell scripts, RabbitMQ  
Influx, MySQL, grafana

Xeon E5-2643 v4(6 cores) x 3

**Maximal use open source solutions !!**

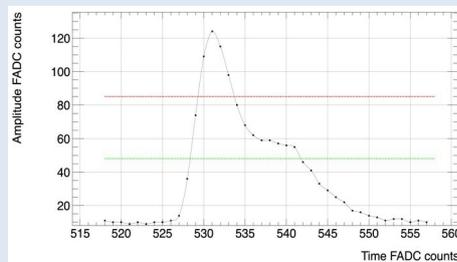

# How detector works

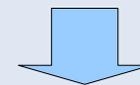

## Base detector operation mode

- coincidence pair OM's
- coincidence window 100 ns. (CM) / 500 ns. (Cluster Centre)
- acknowledgment from Cluster Centre
- FADC data filtration
- RUN duration : ~24 hours
- FADC thresholds : ~1.5-2.0/~ 4.0 ph.e
- Rate : 10 – 150 Hz from cluster

**Raw data from each master (CM) :**  
header (time, master #, counters)  
+ wave form

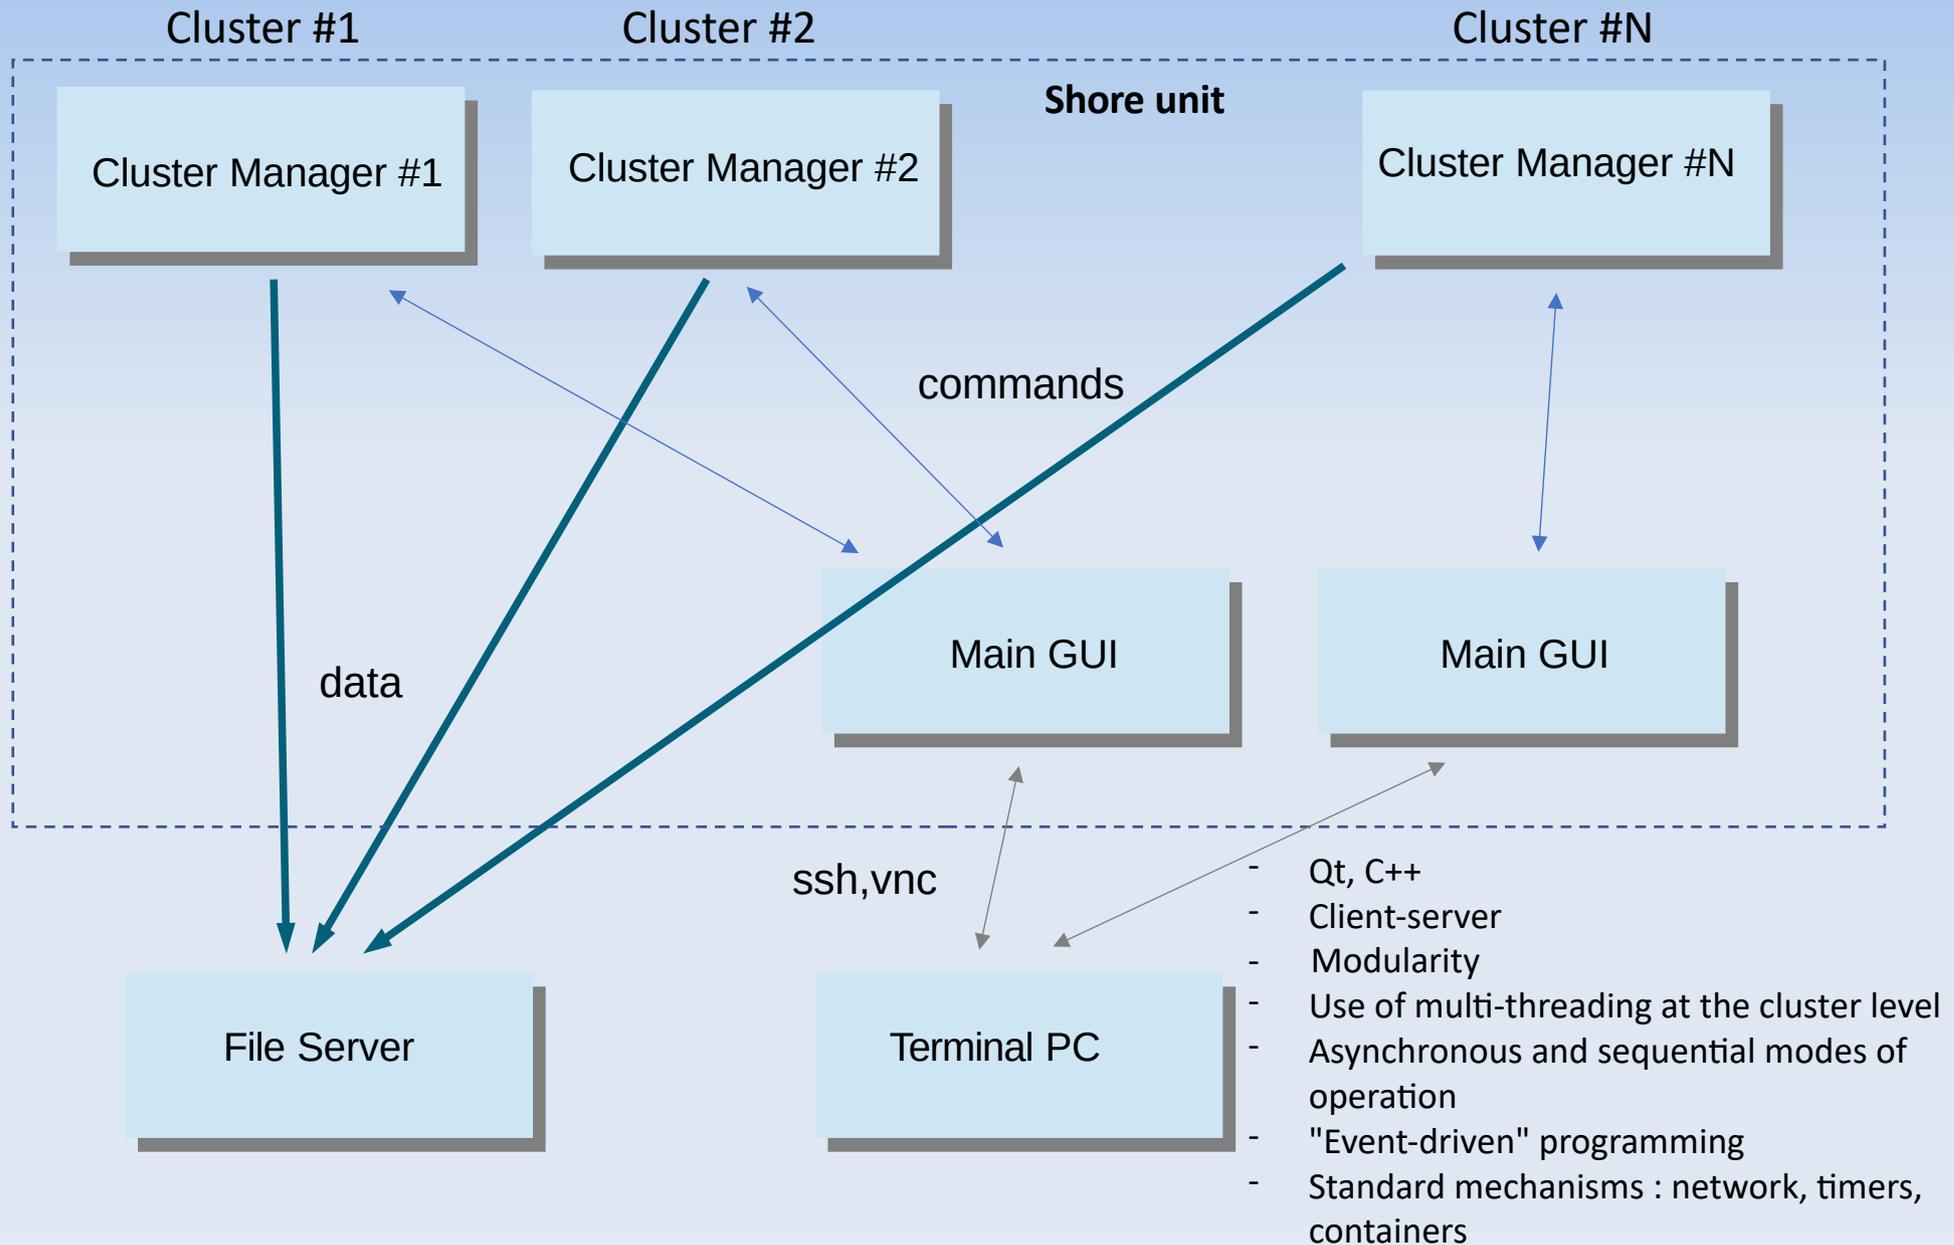

**data from all masters can  
be combined into a single  
physical event**

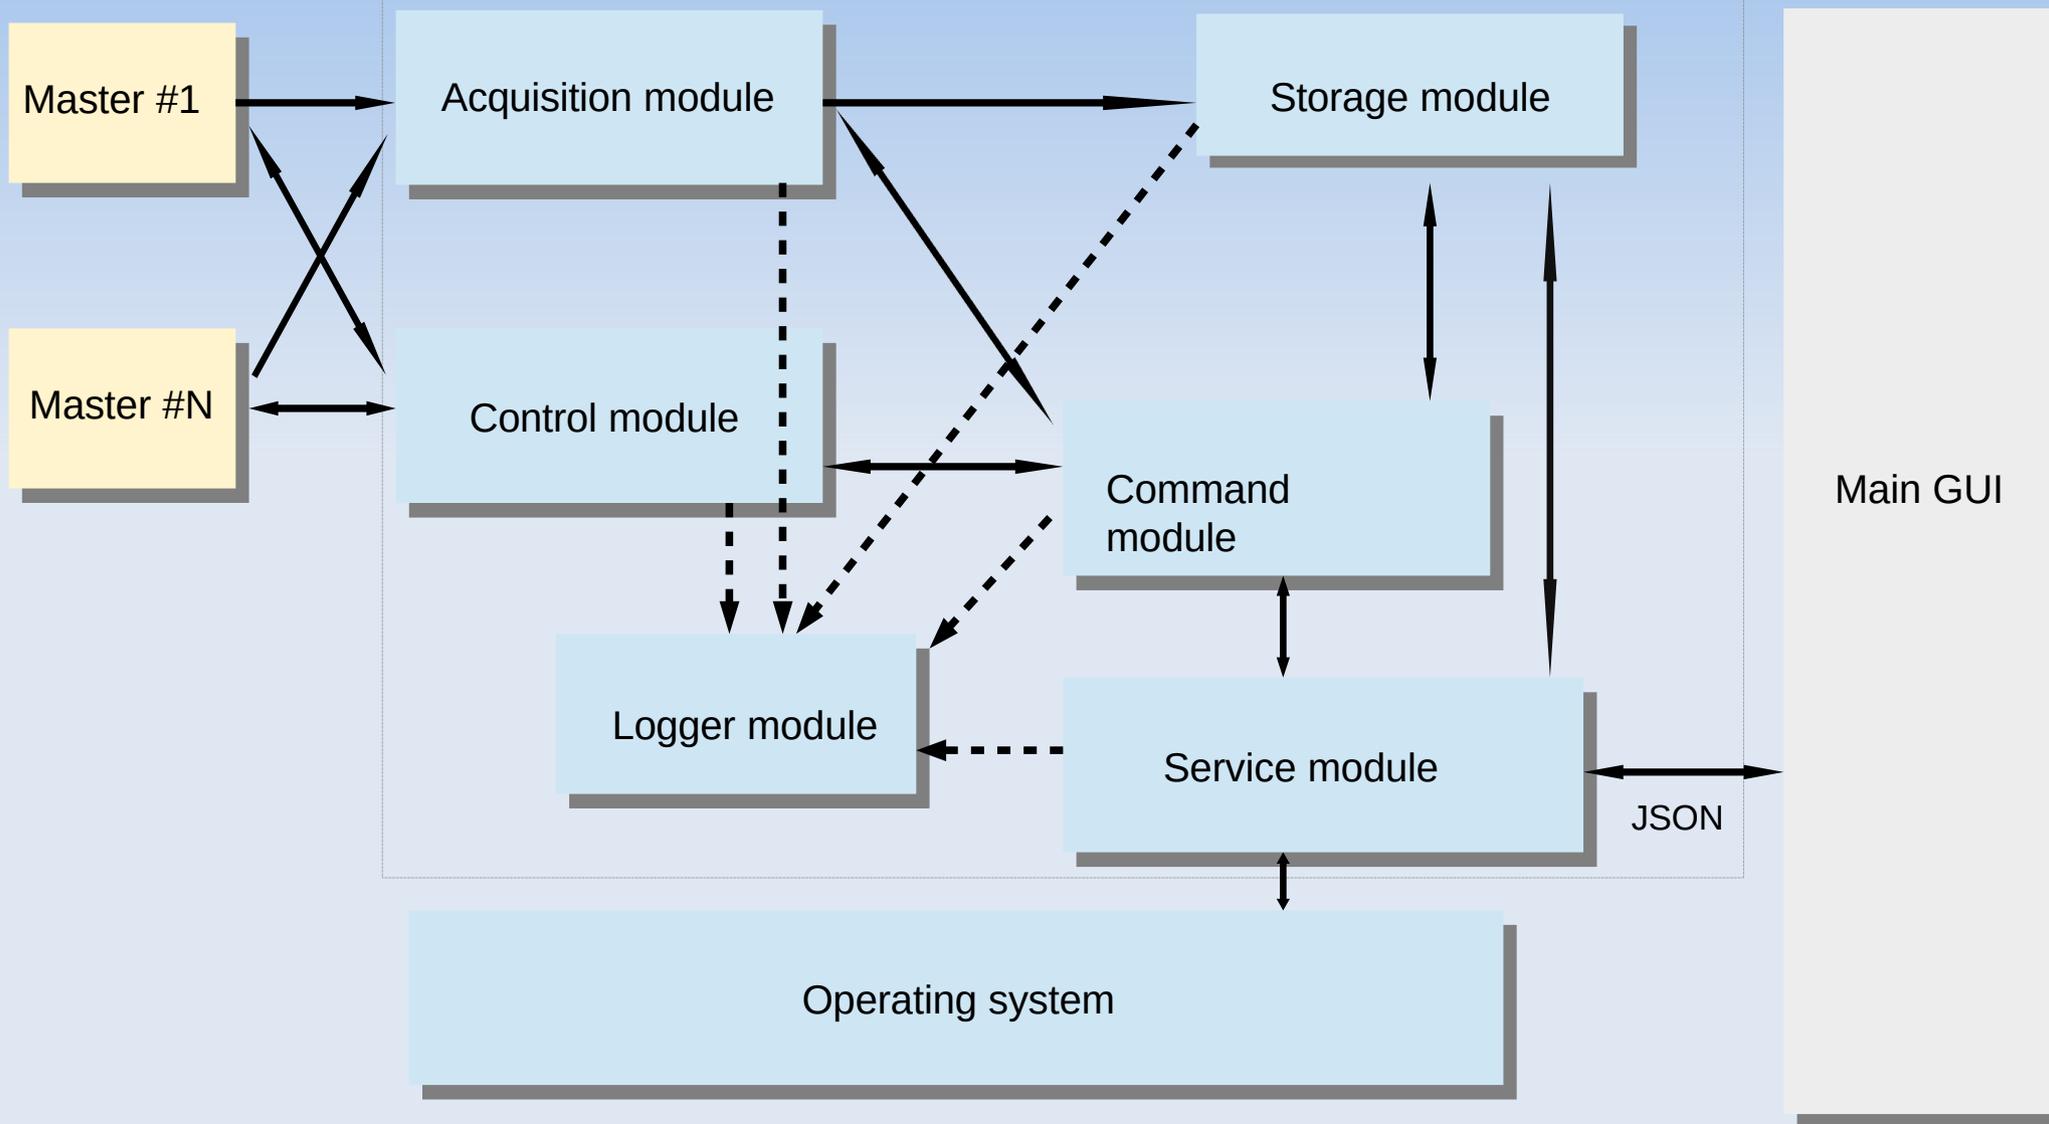

# Main Program : Architecture

# Main Program : ClusterManager

run as **systemd** service for each GVD cluster

# Main Program : GUI

[1] GVD MAIN v1.6 04 Apr. 2025 (Parallel Edition)

Configuration Tools LED Monitoring

Cluster # 1

CLUSTER #1 RUN : 238 FILE : 1 Muon RUN Standard Rate : 59.1 Kb/s

- Simple for use
- Single & multi – cluster
- Semi-automatic
- CPU usage for base RUNs < 5 % !
- RUN restart time (if NO hardware failure) < 3 min.

# Data monitoring : Base

**The telescope produces a considerable amount of monitoring data produced by multiple independent sources:**

Underwater components:

- OM-level sensors: humidity, pressure, HV etc.
- Power commutators.
- Acoustics.
- System module level sensors.

Communications equipment monitoring.

Shore power supplies.

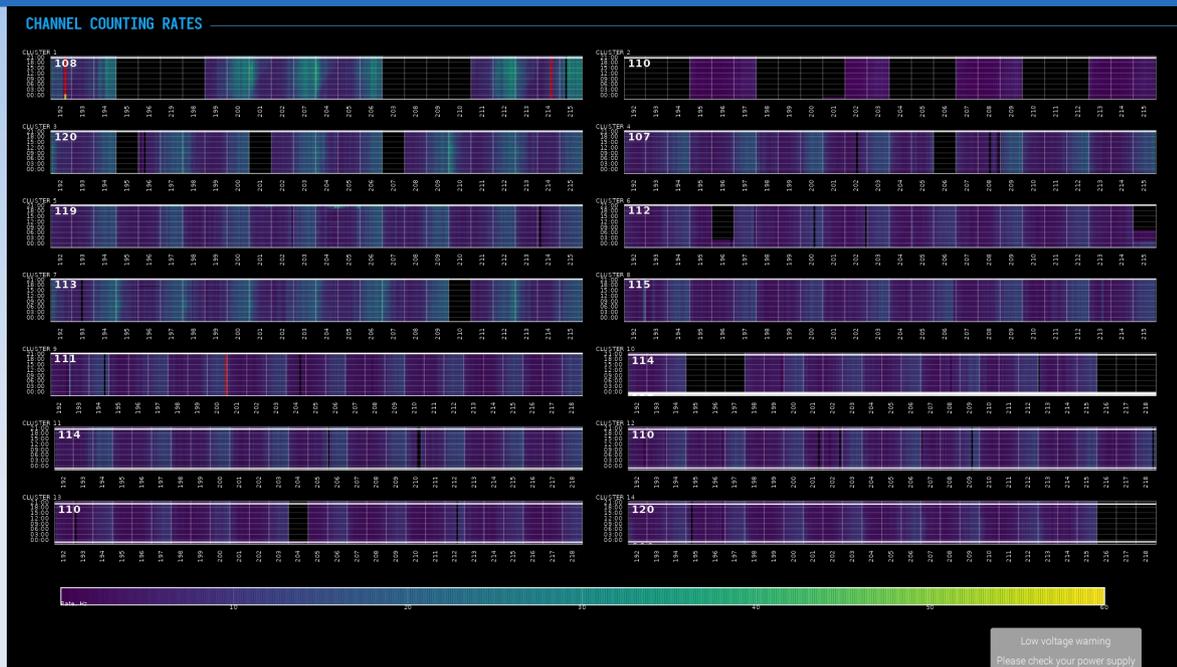

OM counting rates.

**The goal is to aggregate the monitoring data, making it available for comprehensive analysis and shifter-level alerts.**

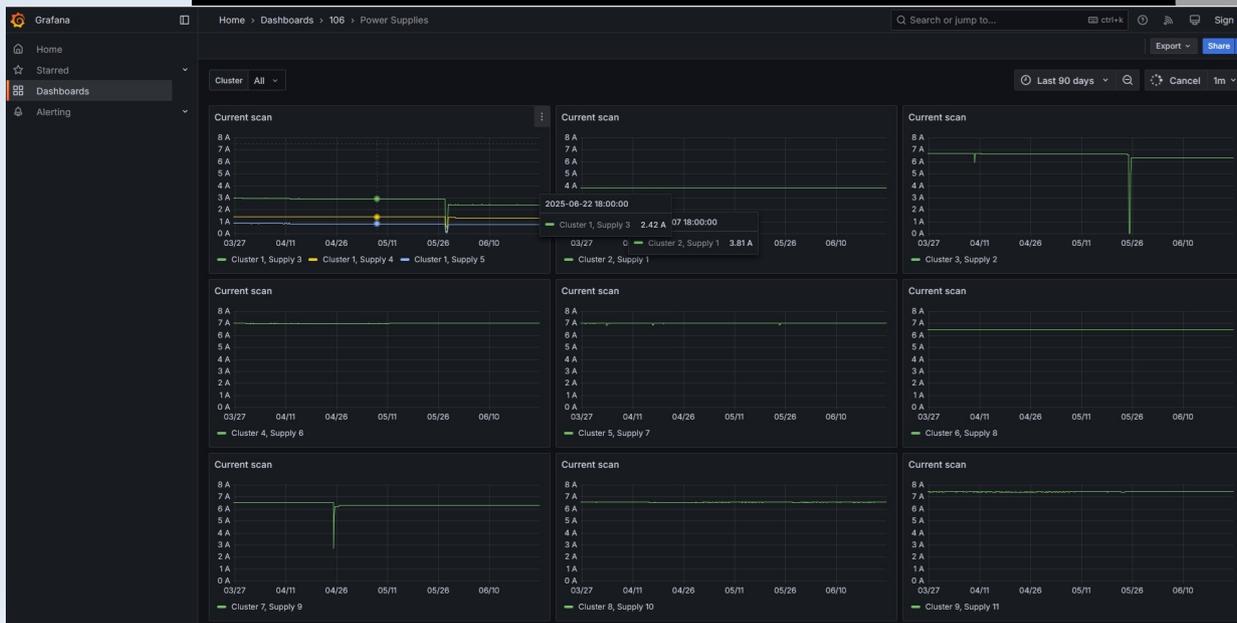

# Data Monitoring : Shore

**Shore Station:** Voltage monitoring, event rates, detector occupancies, OM sensor data at web-based dashboard, detector geometry monitoring, thunderstorm alarm

Shore power supplies support online monitoring. Each power supply box is polled Every 5 seconds, V and I are stored locally, sent to JINR and displayed to the shifter.

# Data Monitoring : underwater network

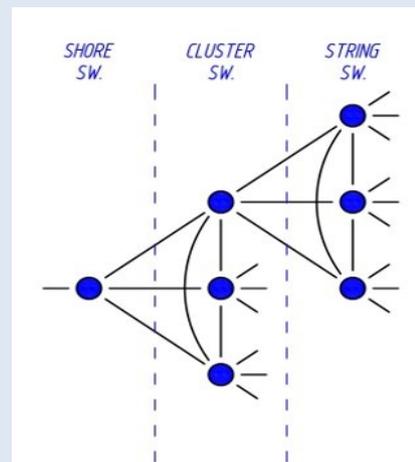

## Underwater networking

- Reachability of the addressable detector components:
    - Regularly tested via ICMP (ping && fping) from the shore.
    - Output is stored locally at the moment, integration in progress.
    - Current status available to the shifter.
  - MOXA hardware provides some statistics on network operations (number of packets in/out).  
We look at this data if something goes wrong. The applicable hardware includes:
    - Switches in the Cluster Center.
    - DSL modems in the Cluster Center, String Modules and Section Modules.
- NPorts in String Modules and Section Modules.

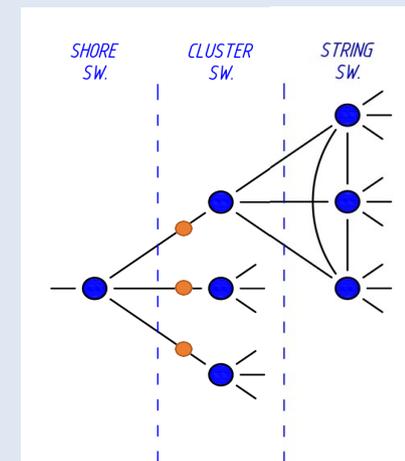

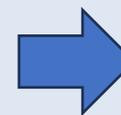

## Shore Network Organization (since 2023)

- VLAN technology are supported by Baikal-GVD network devices
- VLAN based network is introduced on shore switch and servers
- Virtually separated networks
- Peer-to-peer network -> multi-level network

Significantly (10 times) reduced the number of “freezes” of DSL modems

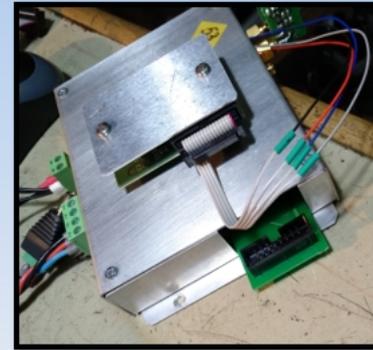

**P2P Network**  
each connect with each

**Multi-level Network**  
separated on shore switch

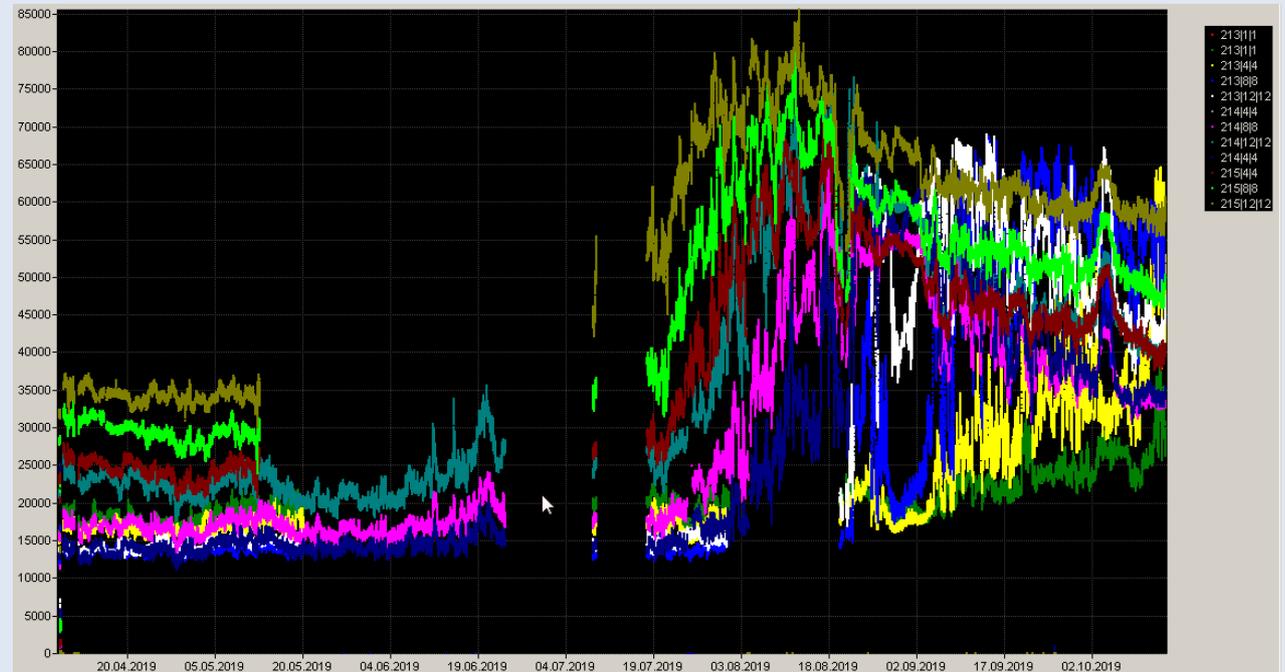

# Data Monitoring : OM parameters

OM Controller with sensors block

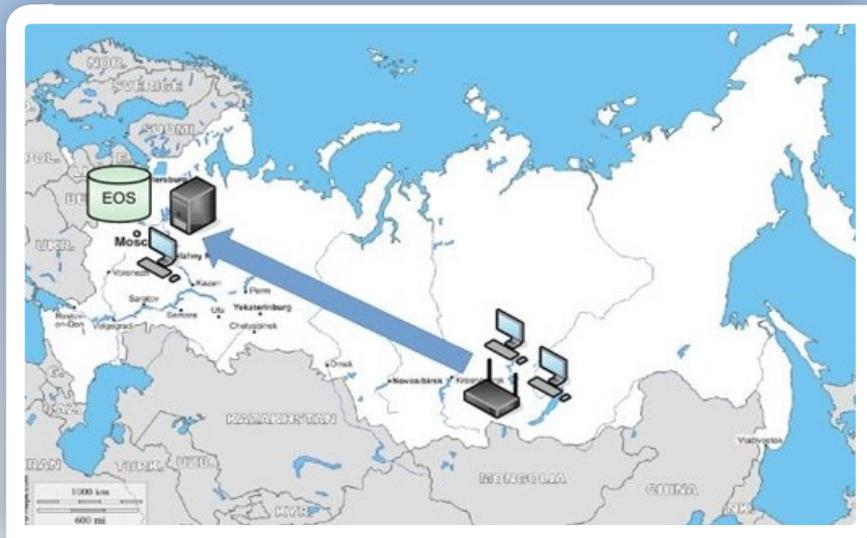

## OM parameters monitoring

Controller Uptime  
PMT High Voltage  
3 x Onboard Voltage  
Controller Temperature  
PMT Pulse Detector Rate  
Inside Air Temperature  
Relative Humidity  
3 Axis Acceleration (Gravity)  
3 Axis Magnetic Field Strength  
Inside Air Pressure

# Shore Station & Data Stream

**Raw data are transferred from the Shore Center to JINR:**

Shore center → Baikalsk: 300 Mbit/s radio-channel

Baikalsk → JINR: standart Internet communication

Compressed data volume ~40-150 GB per day

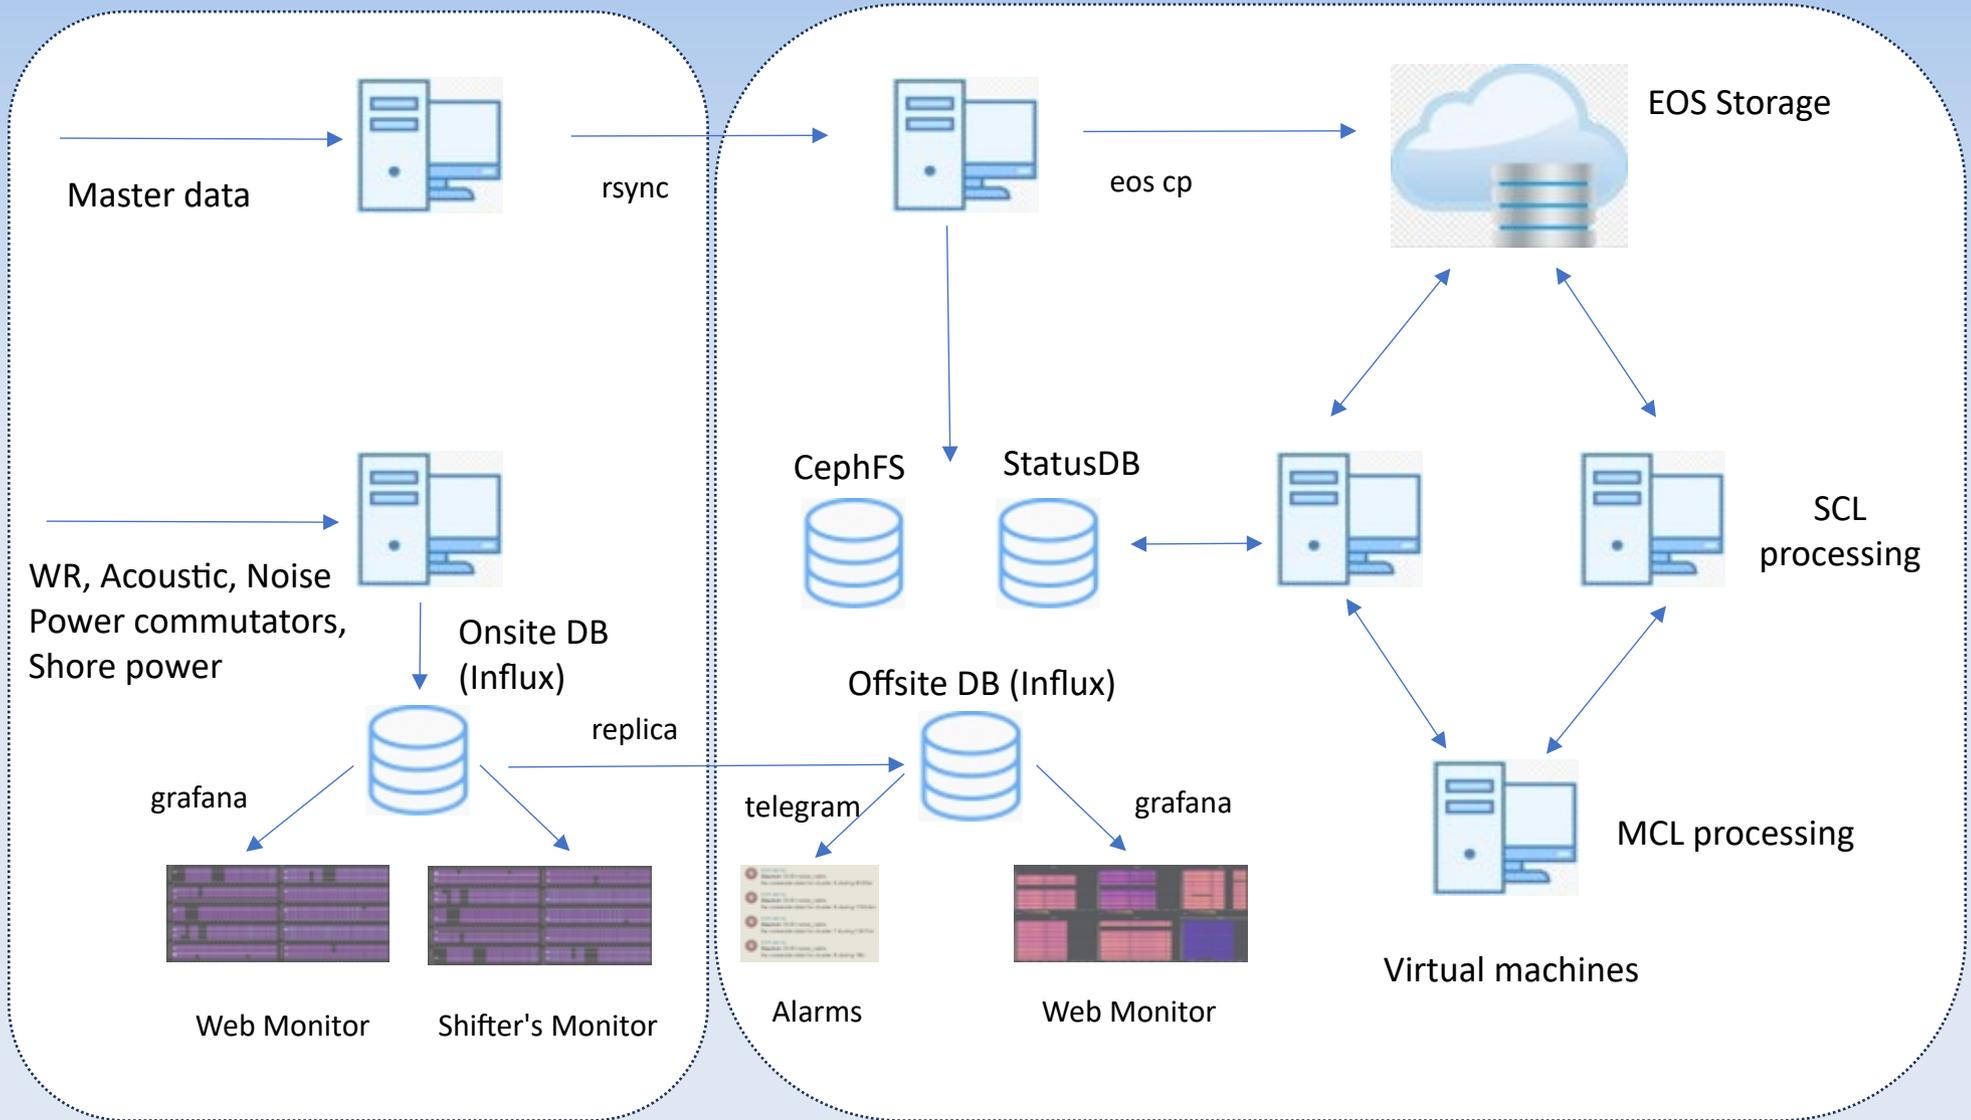

Full-scale reconstruction at JINR

Delay due to shore - JINR data transfer < 1 min

# Data flow : Overview

# Conclusions

- **An almost complete set of software for collecting, monitoring and storing detector data has been developed**
- **Data acquisition software proven to be reliable and efficient (detector efficiency for 2024 : ~96 % )**
- **Over the last years most of the monitoring tools has been streamlined: data formats are documented and available via a central repository (JINR GitLab). New monitoring data is regularly pushed to JINR.**
- **The completion of work on the creation of 1 km<sup>3</sup> Baikal-GVD detector with ~6000 OM's is planned in 2027/2028**

**Thank you for attention !!**

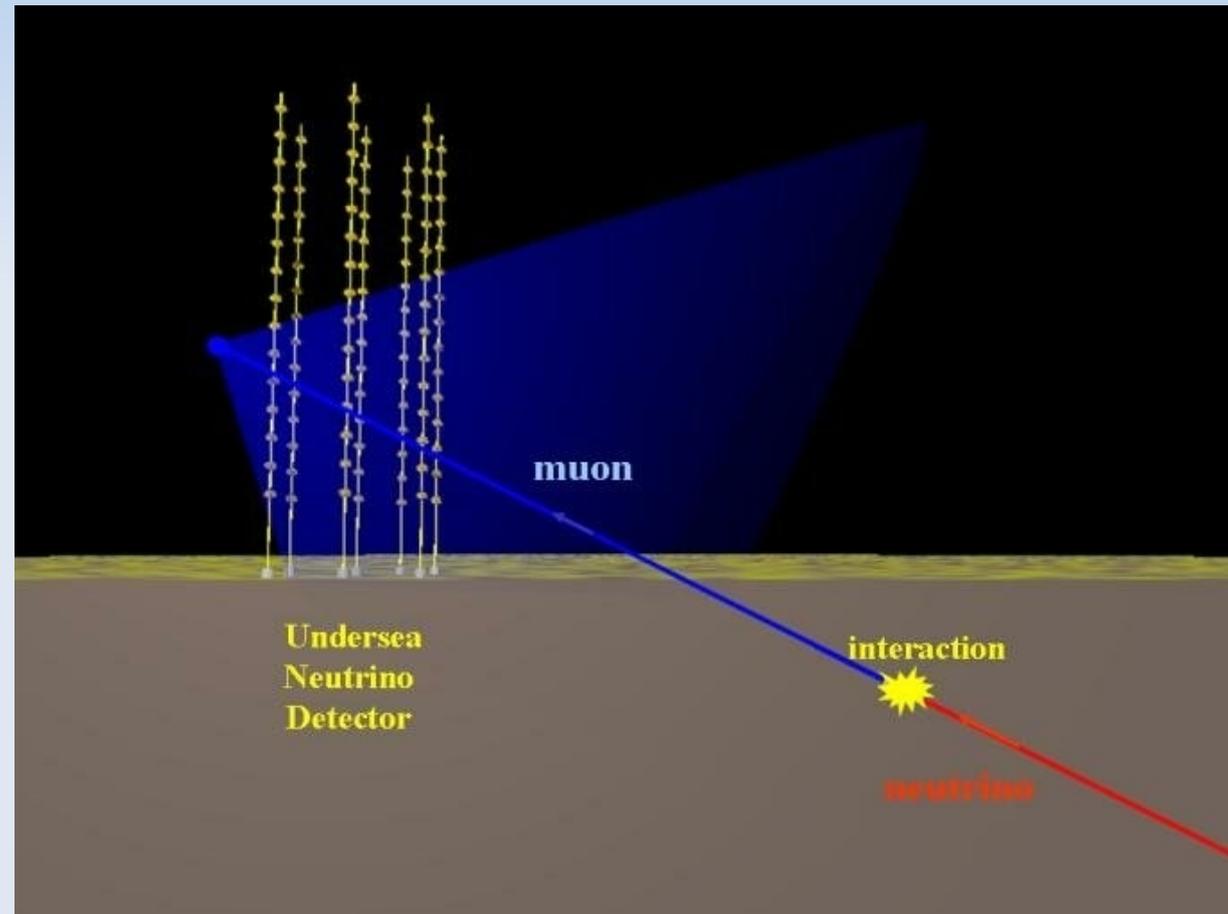

# Backup slides

# Neutrino detection

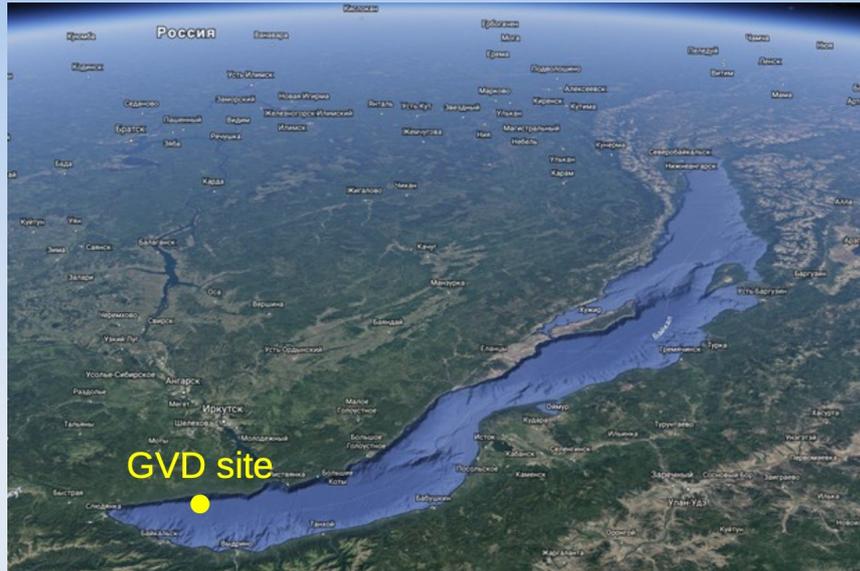

Based on idea from M. A. Markov, 1960  
recording Cherenkov radiation from secondary  
muons and/or high-energy showers produced  
by neutrinos during their interactions with  
matter in transparent natural media

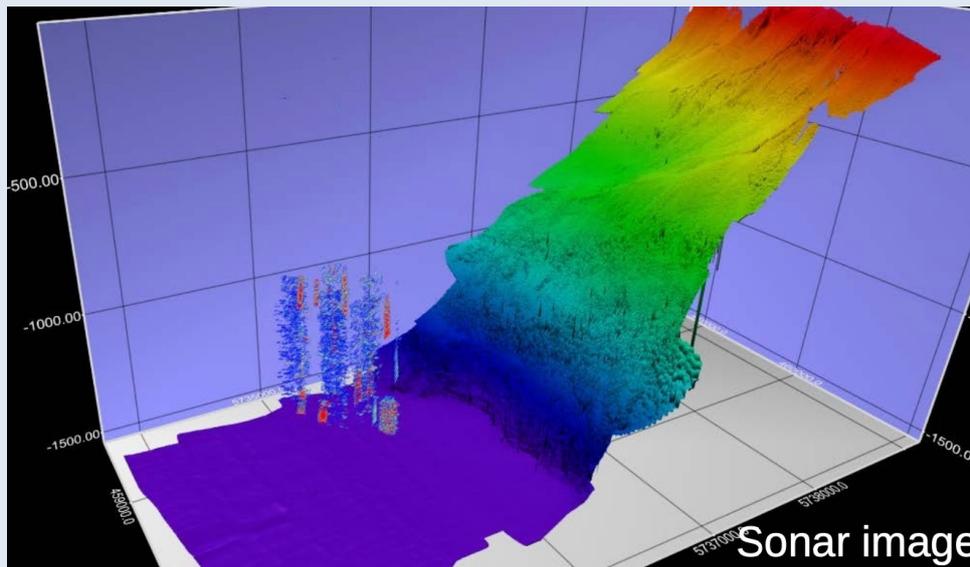

# Baikal-GVD Site

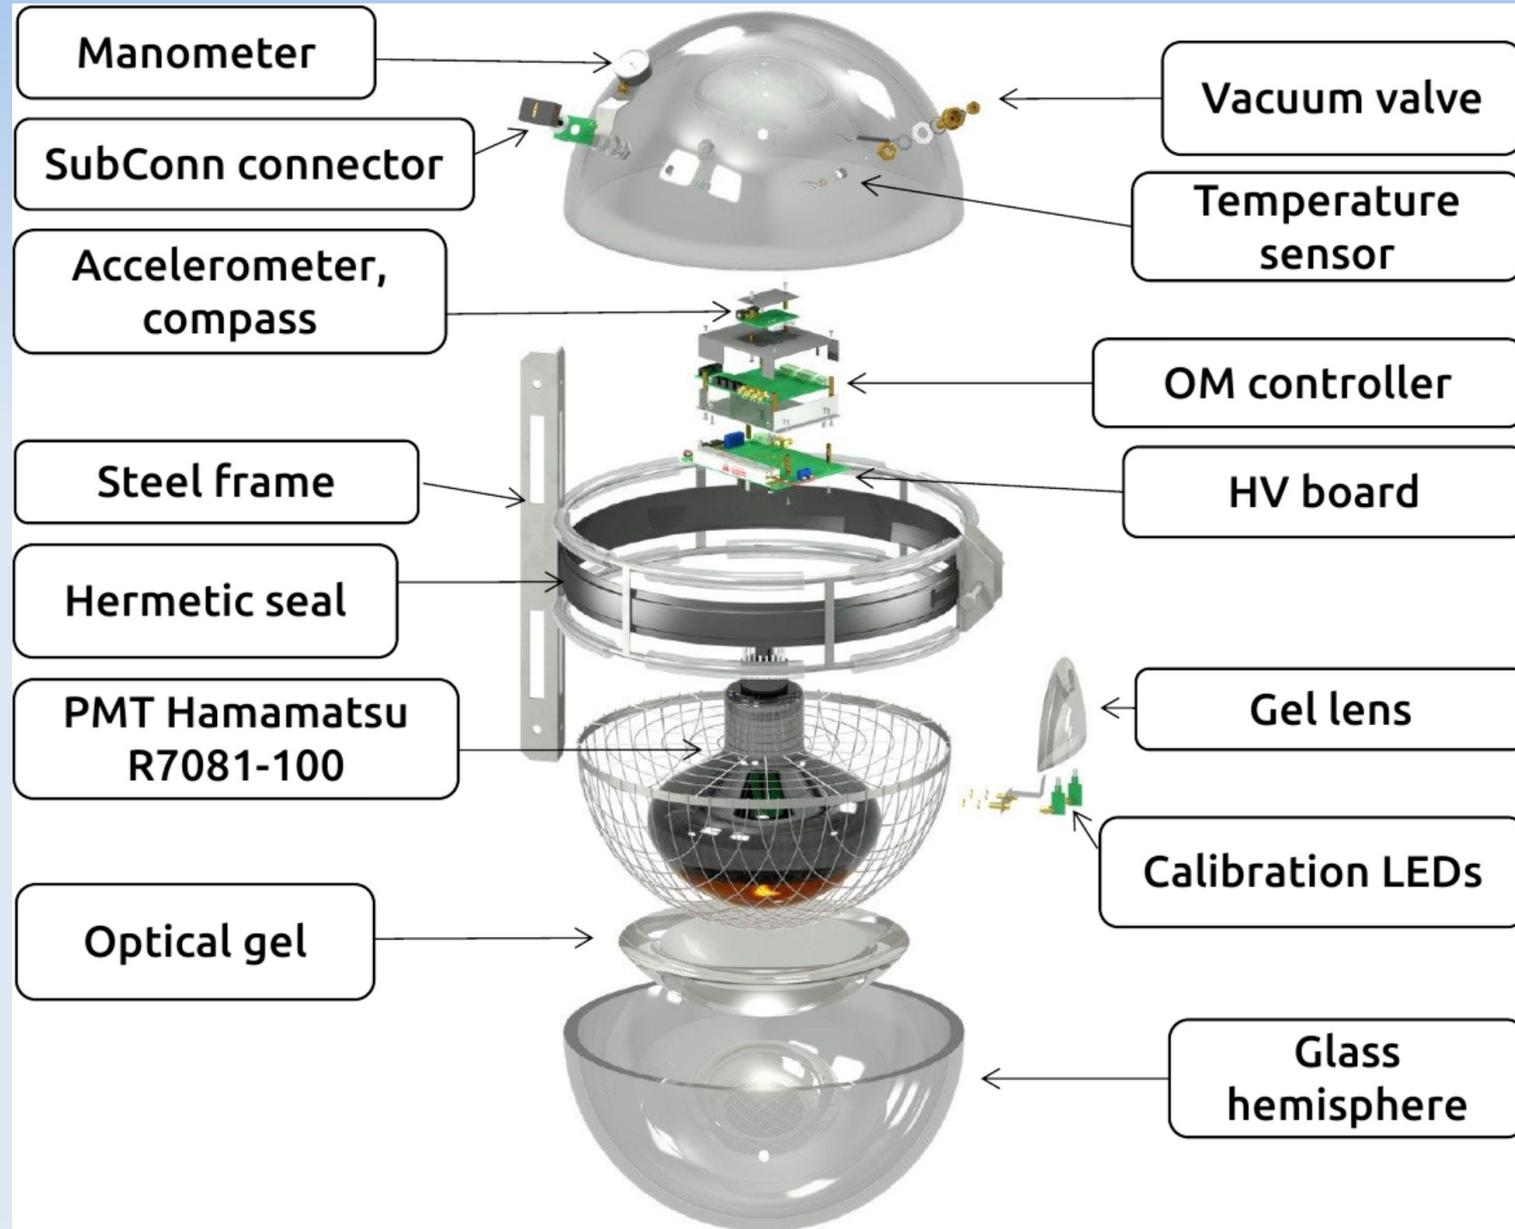

- Southern basin of the lake
- ~3.6 km offshore
- Flat area at depths 1366–1367 m
- High water transparency
- Railway infrastructure
- Moderately low optical background: 15–50 kHz
- Deployment from the ice cover of the lake

# Optical Module

- 17 inches sphere (42 cm)
- 10 inch Hamamatsu PMT R7081-100

# Data Monitoring : JINR

**JINR: A posteriori data quality monitoring (DQM) within BARS framework, databases**

- **DQM:** Uniformity of event rate, hot channels, charge distributions, charge calibration
- **Dashboard:** web-based interface to JINR databases containing OM sensor data, detector geometry data, HV and LV data, run info, data processing status

**BAIKAL-GVD RUN EXPLORER**
