Identified Hadrons Measurements (π, K, p) in XeW@2.5 GeV (MPD-FXT)

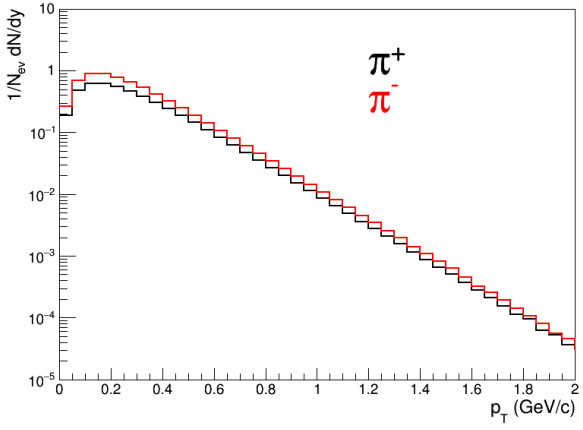
M.Malaev, D. Ivanishchev, V.Riabov

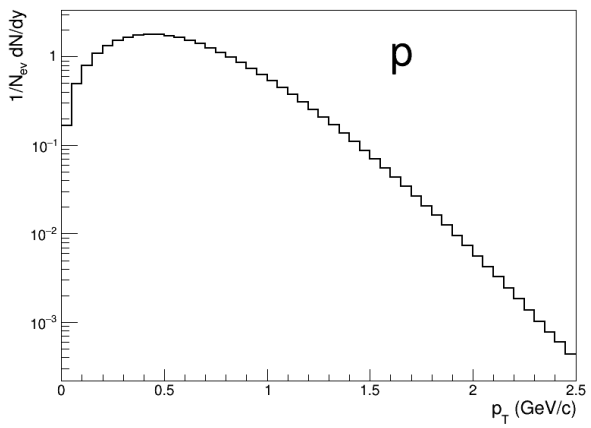
* We acknowledge support from Russian Ministry of Education and Science, state assignment for fundamental research (code FSEG-2025-0009)

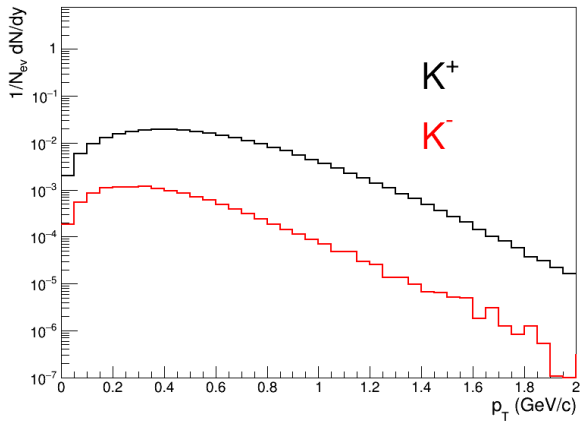
Outline

- Light charged hadrons spectra (π/K/p) needed
- Simplified approach based on n-sigma method for TPC/TOF:
  - ✓ limited pT range at higher momenta
  - ✓ minimization of model-dependent corrections
  - ✓ robust → most appropriate for the first-day analysis & results
- Before: results in BiBi@9.2 collisions
- Today: analysis details and results in XeW@2.5 AGeV (fixed target mode)
- Data: Request 36, 15M UrQMD events, Xe-W(T = 2.5 GeV/n, FTX)

Generated spectra

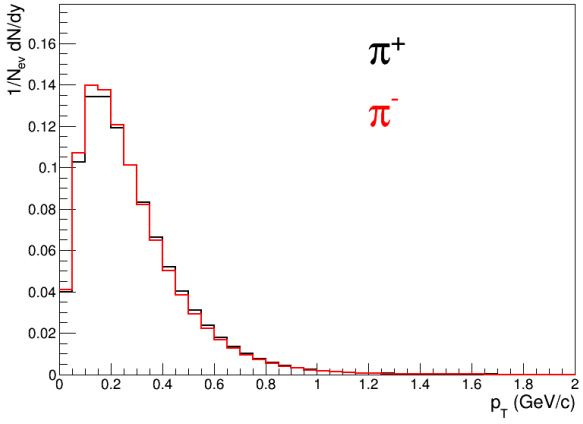


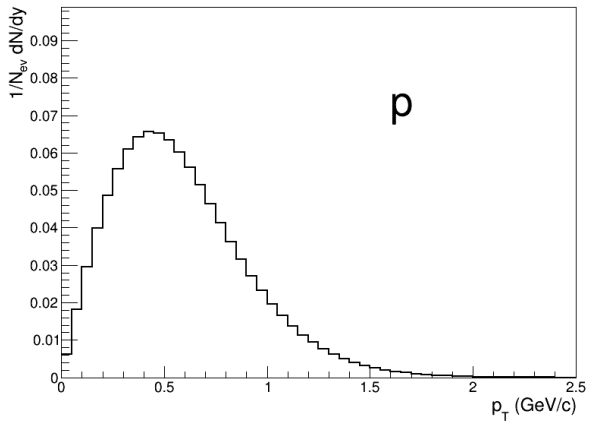


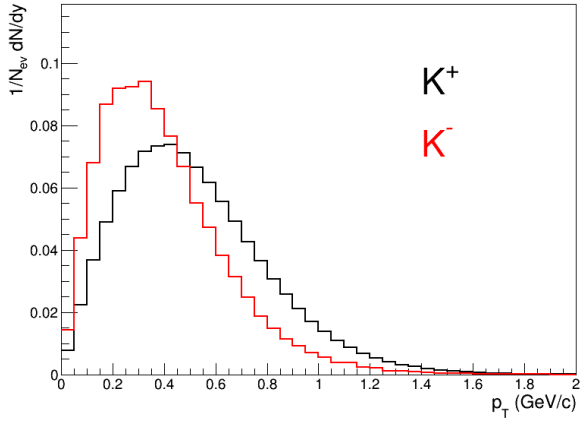


❖ Almost no difference for pions; NO antiprotons; considerable asymmetry for kaons

Normalized Spectra







❖ Spectra are soft → low p_T part is very crutial

Fraction of spectrum lost (p_T dependence)

- The fraction of total spectrum lost if spectrum starts from p_T in the most left column

St pT	Proton	Pi+	Pi-	K+	K-
0.05	0.005	0.037	0.037	0.007	0.014

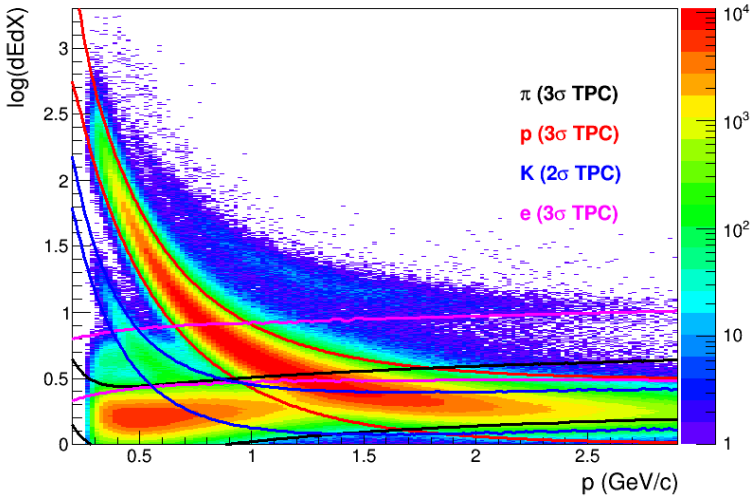
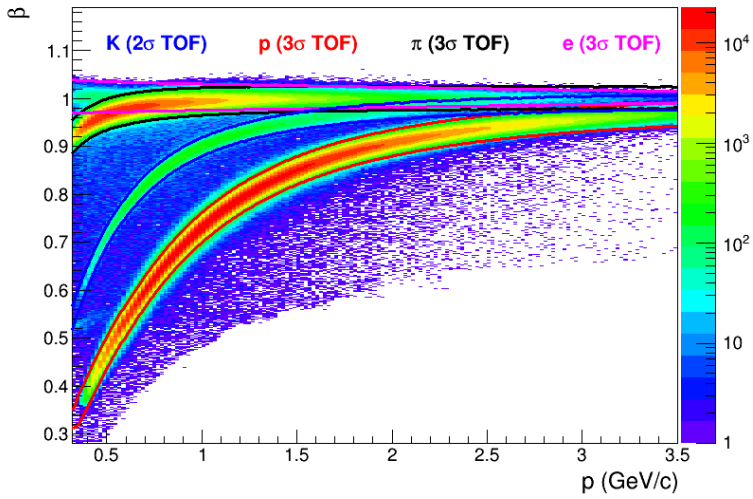
PID strategy (π, P)

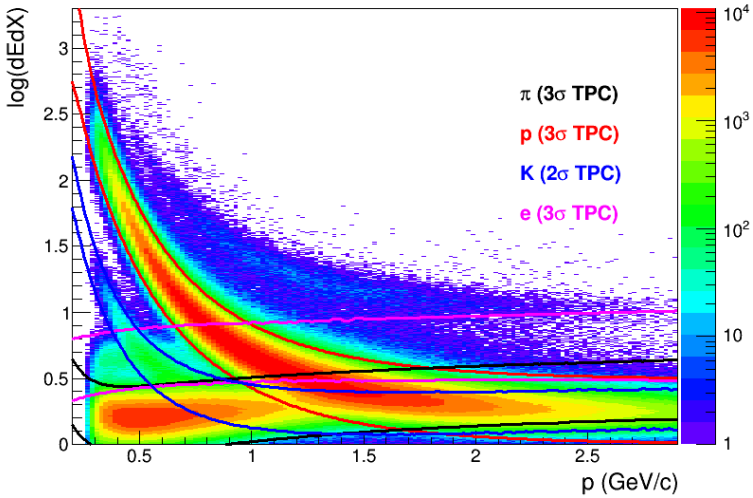
- Event selection: centrality 0-90%
- Track selection:
  TPC-hits > 24
  DCA-to-PV < $2\sigma_{x,y,z}$
  $|y_{cms}| < 0.5$
- Two quasi-independent measurements for π/p:
- 1st: (**TPC-TOF**)
  TPC 2 σ -PID selection for a given specie (π/p)
  If track is 2 σ -matched to TOF then TOF 2 σ -PID selection for a given specie (π/p)
- 2nd: (**TOF-TPC**)
  TOF 2 σ -PID selection for a given specie (π/p)
  TPC 2 σ -PID selection for a given specie (π/p)
- Spectra are reconstructed while purity > 95%:
  spectra are corrected for impurities → impose 50% uncertainty for the correction value = 0.5 * 5% = 2.5% pT-correlated systematic uncertainty for spectra
- **TPC-TOF** and **TOF-TPC** spectra are combined for final results for minimum total uncertainties

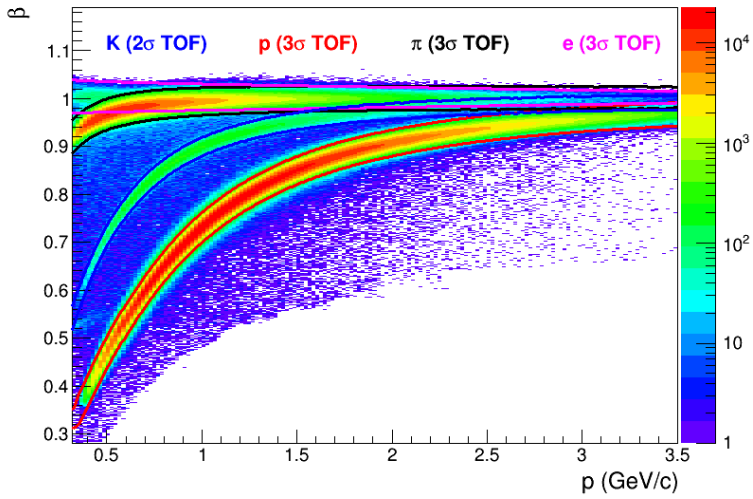




PID strategy (Kaons)

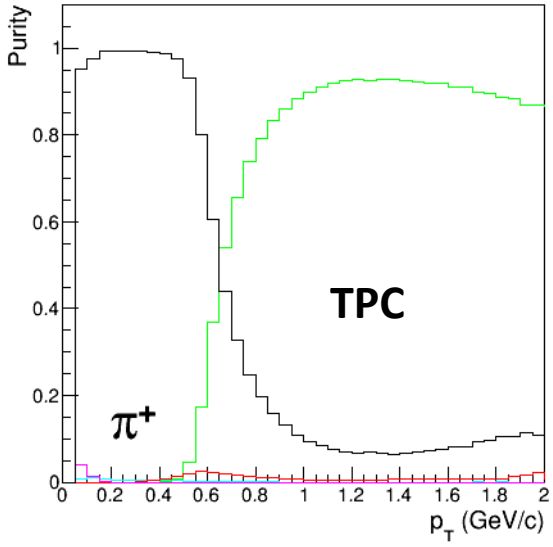
- Event selection: centrality 0-90%
- Track selection:
  TPC-hits > 28
  DCA-to-PV < $2\sigma_{x,y,z}$
  $|y_{cms}| < 0.5$
- Two quasi-independent measurements for K:
- 1st: (**TPC-TOF**)
  TPC 1σ -PID selection for a given specie (K)
  If track is 2σ -matched to TOF then TOF 1σ -PID selection for a given specie (K)
  TPC 3σ -veto-PID for other species (for K - e/π/p veto)
- 2nd: (**TOF-TPC**)
  TOF 1σ -PID selection for a given specie (K)
  TPC 1σ -PID selection for a given specie (K)
  TOF 3σ -veto-PID for other species (for K - e/π/p veto)
- Spectra are reconstructed while purity > 90%:
  spectra are corrected for impurities → impose 50% uncertainty for the correction value = 0.5 * 5% = 2.5% pT-correlated systematic uncertainty for spectra
- **TPC-TOF** and **TOF-TPC** spectra are combined for final results for minimum total uncertainties

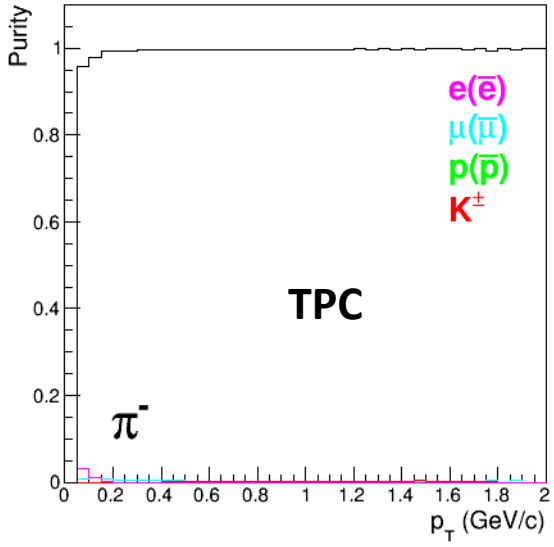


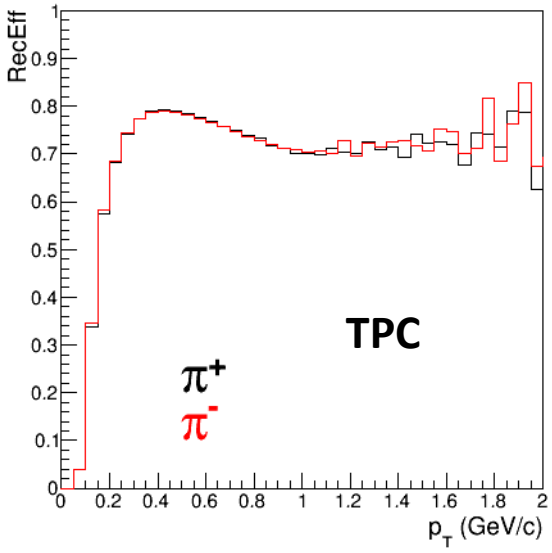


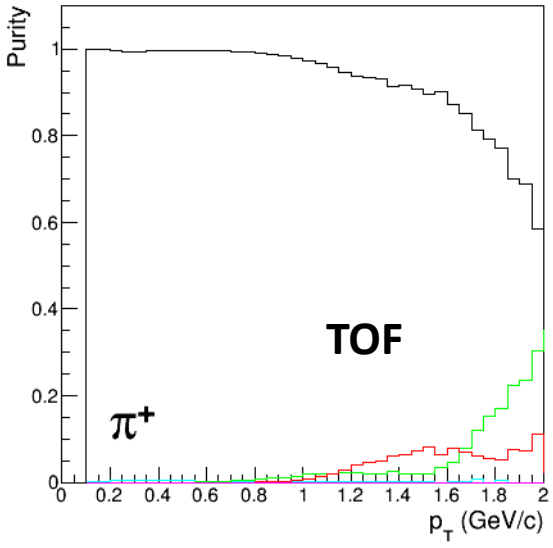
Pions (TPC+TOF→TPC; TOF+TPC→TOF)

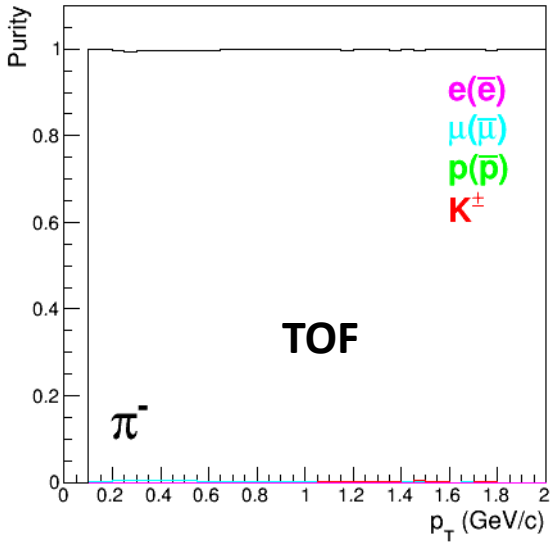
- Accepted p_T range is defined by purity > 95% → whole range is fine for π^- and limits p_T range to ~1.2 GeV/c for π^+

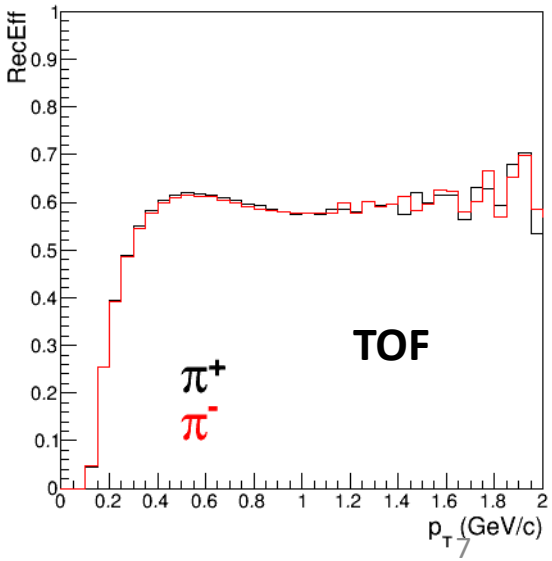






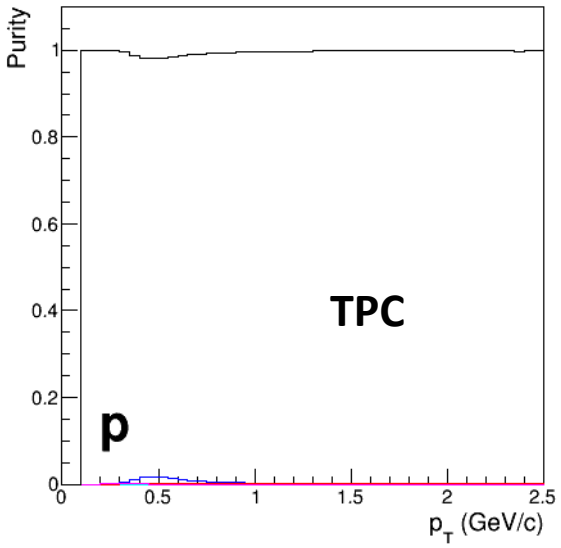


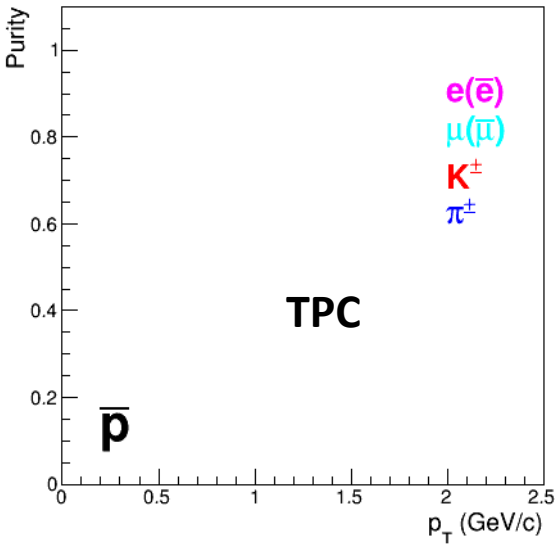


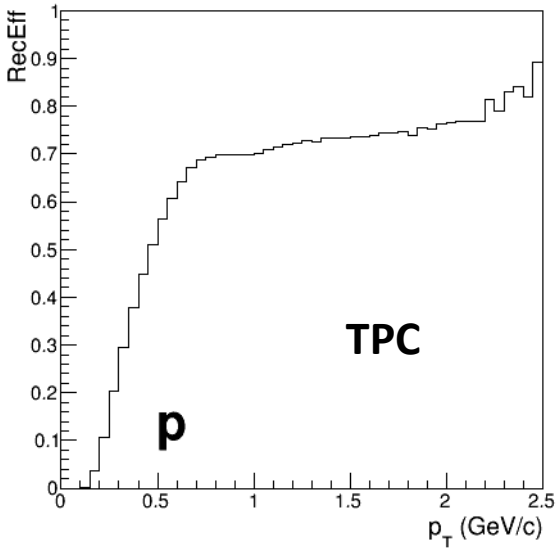


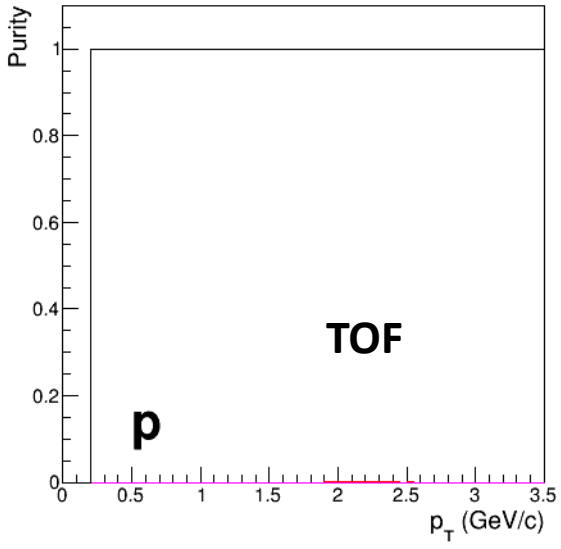
Protons

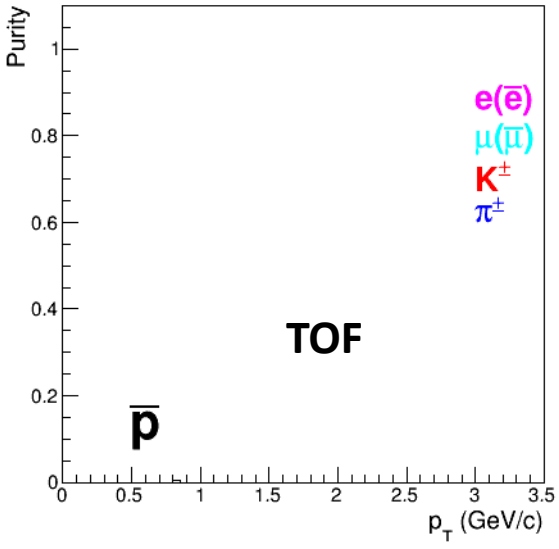
❖ Accepted p_T range is defined by purity > 95% → whole range is fine

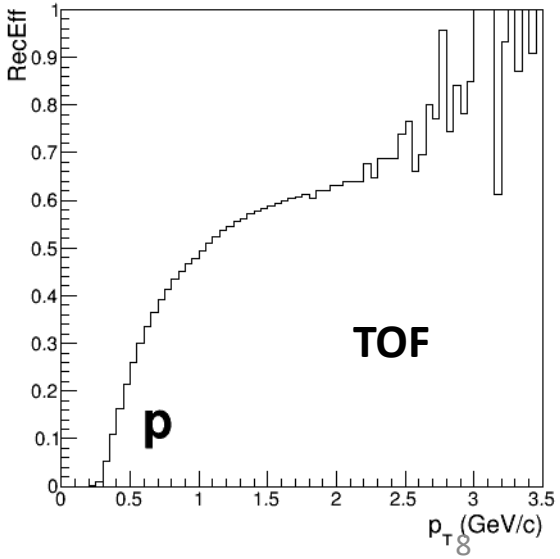






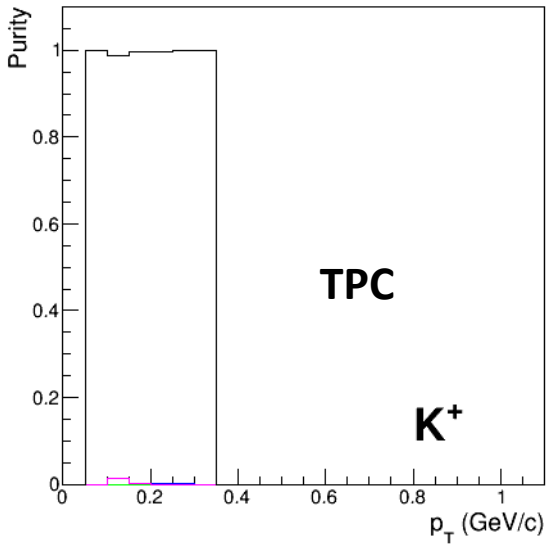


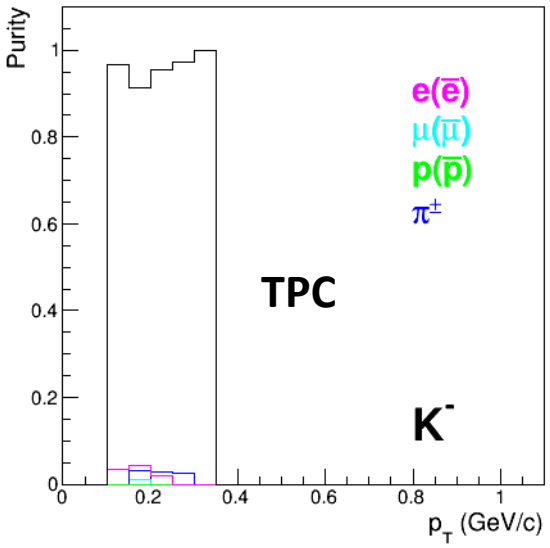


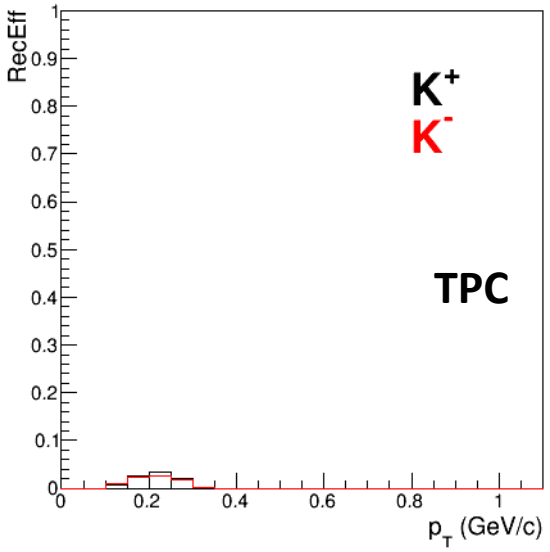


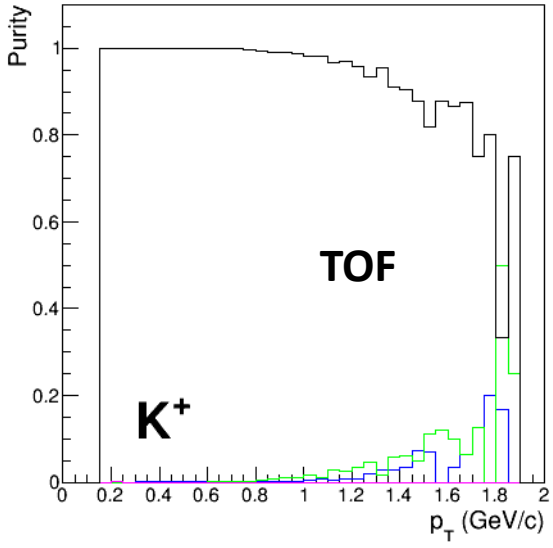
Kaons

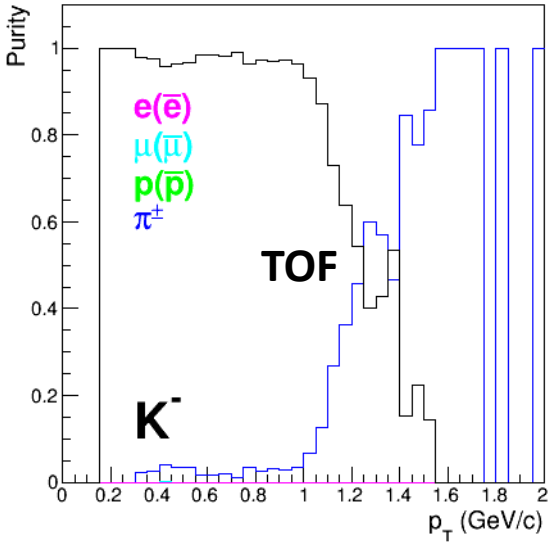
- Accepted p_T range is defined by purity > 90% → limits p_T range to ~1.2 GeV/c for K^+ and ~0.9-1 GeV/c for K^-

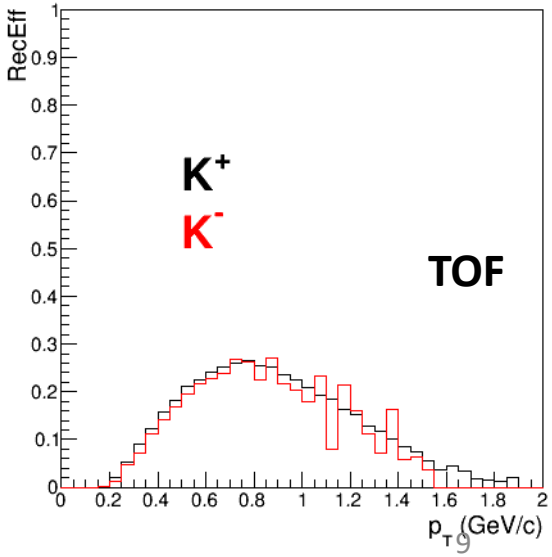






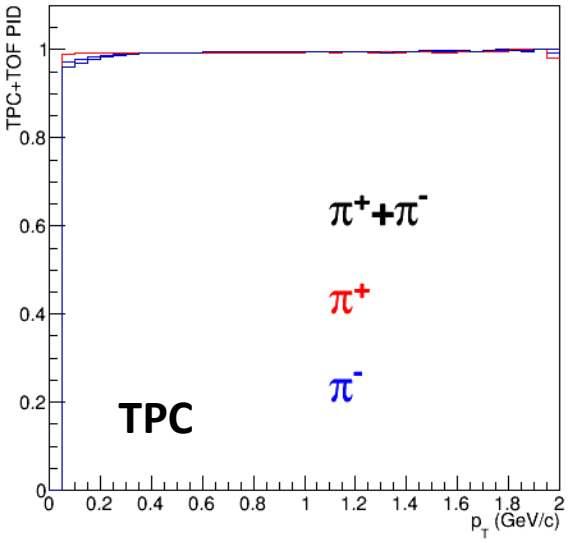


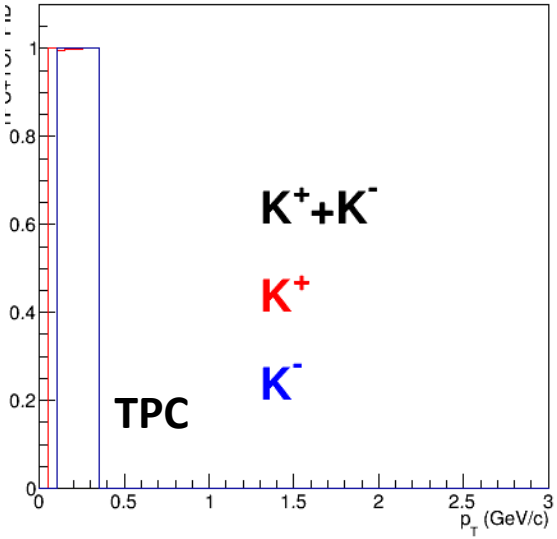


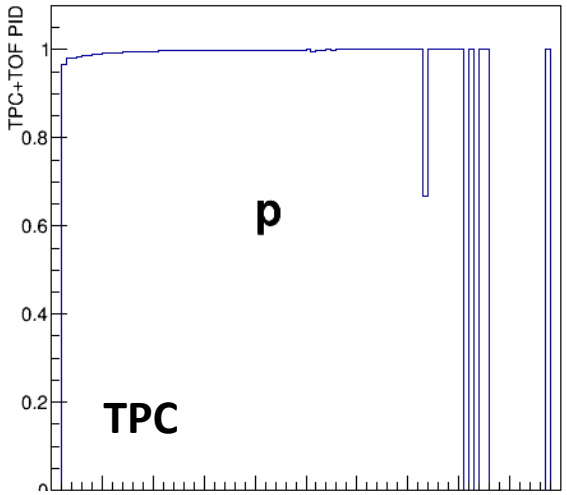


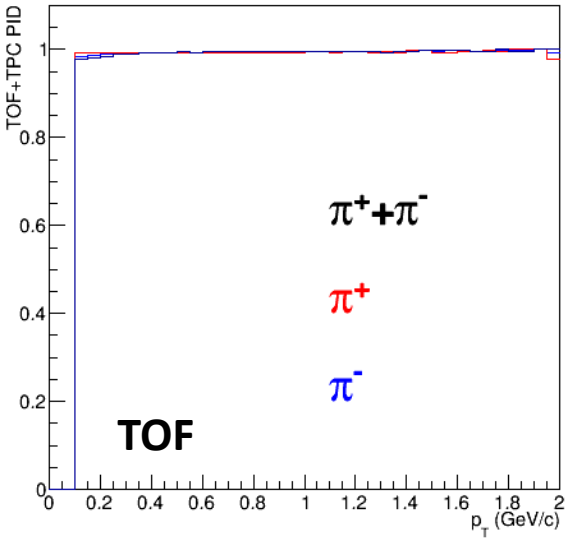
Particle sources

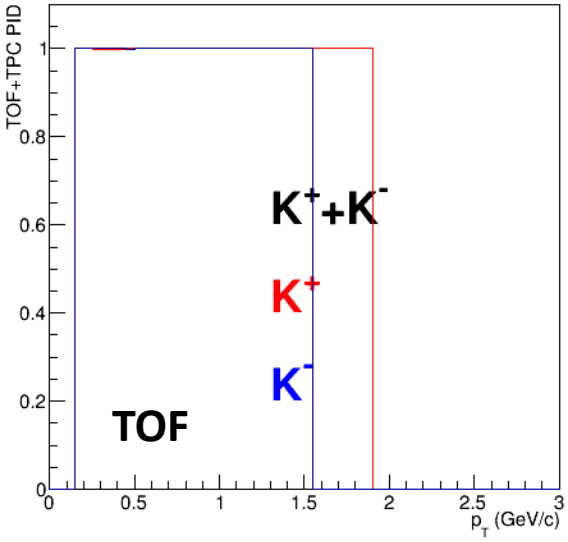
❖ Fractions of primaries in the measured spectrum (primaries – produced at dist < 1 cm from PV

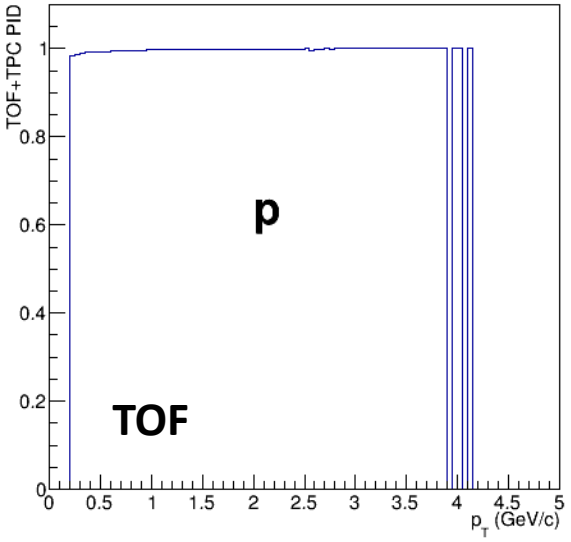








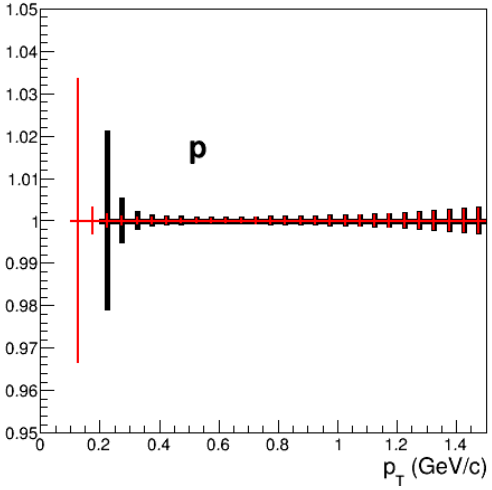


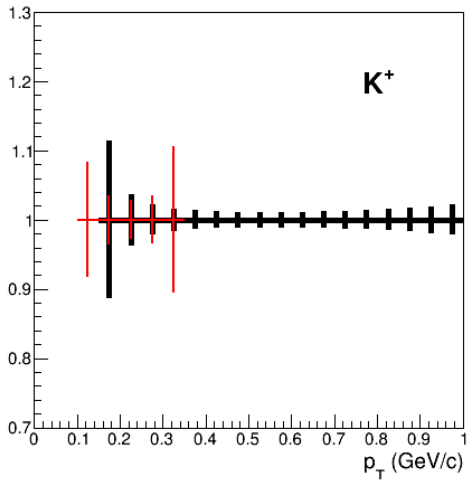


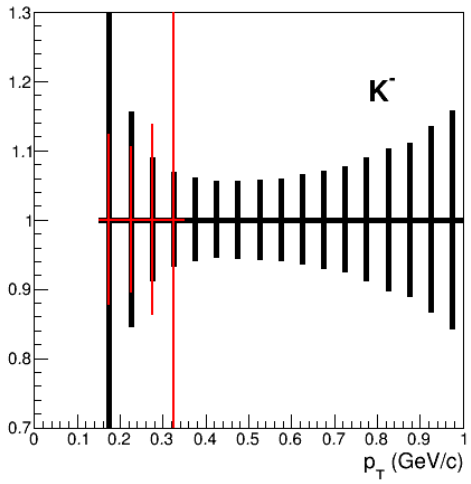
❖ Clean raw spectrum

Combined spectra – transition point

❖ Relative statistical uncertainties for **TPC-TOF** and **TOF-TPC** spectra

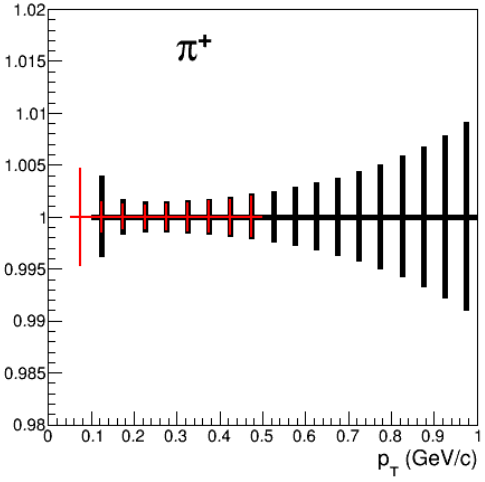


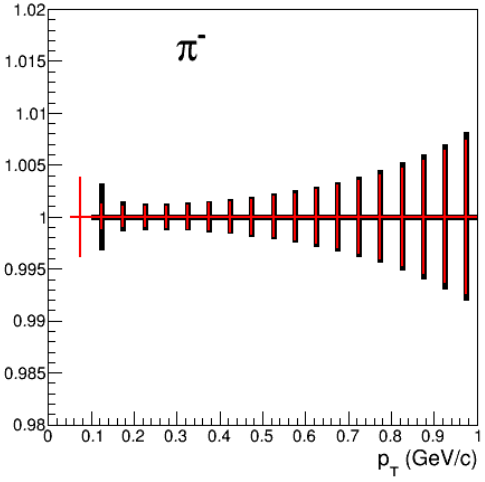




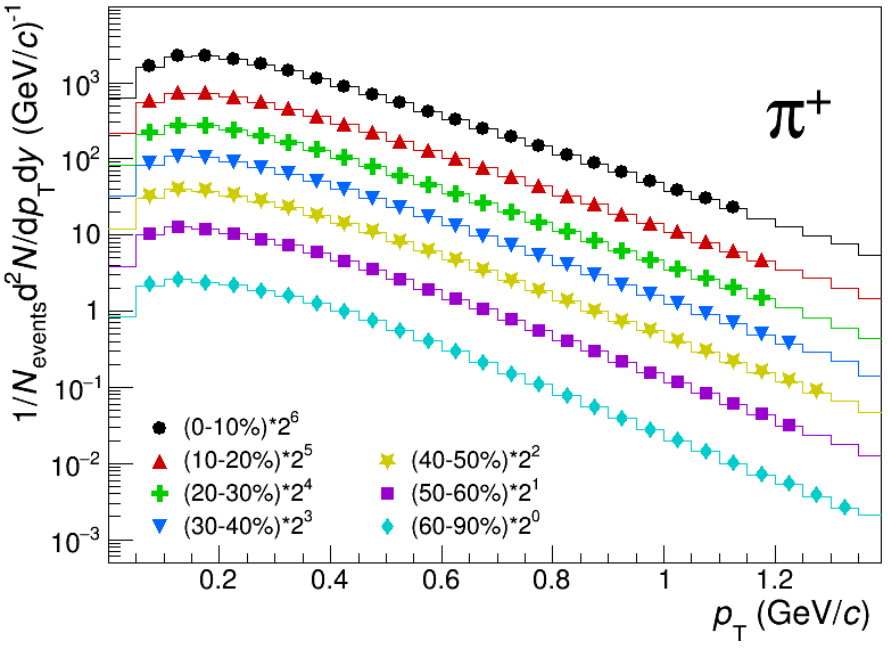
Set transition point (p_T):

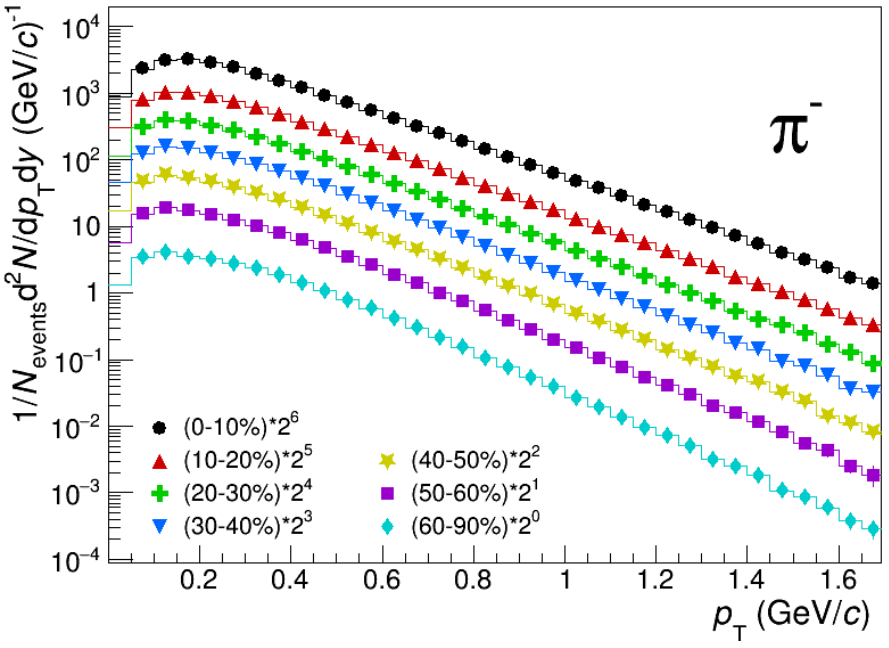
- ✓ K – 0.25 GeV/c
- ✓ P – 0.7 GeV/c
- ✓ π – 0.5 GeV/c



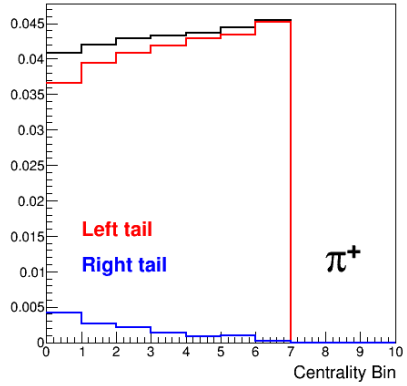


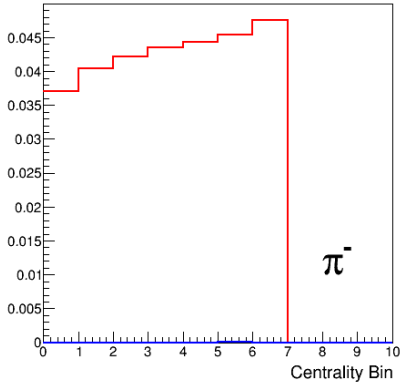
Final Spectra, pions



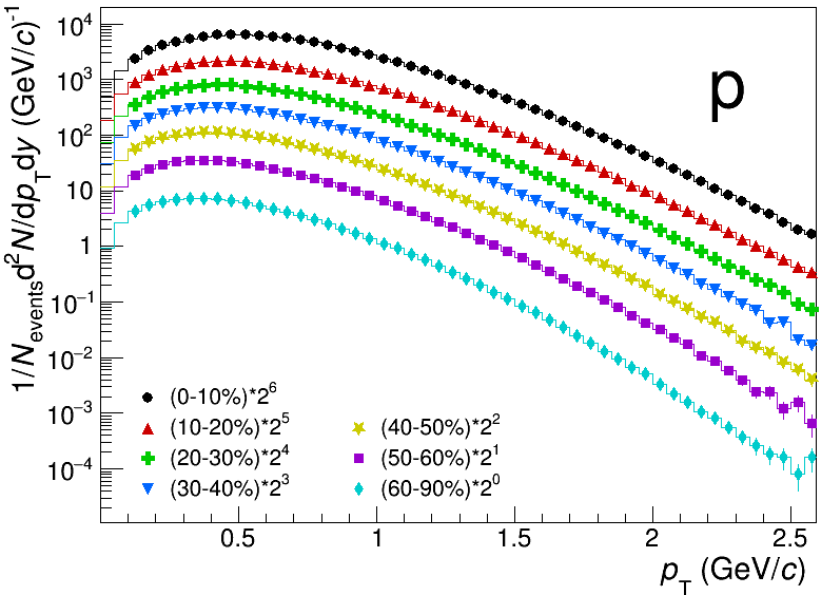


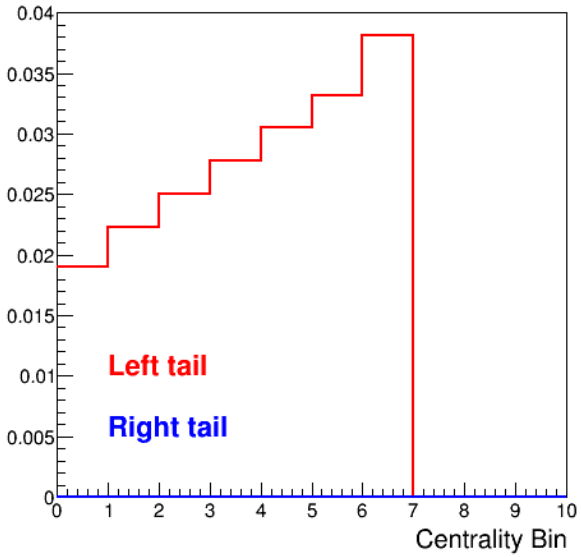
- Start at p_T ~ 50 MeV/c
- Measured spectra sample ~96% of the total yields, loose 4% at low p_T





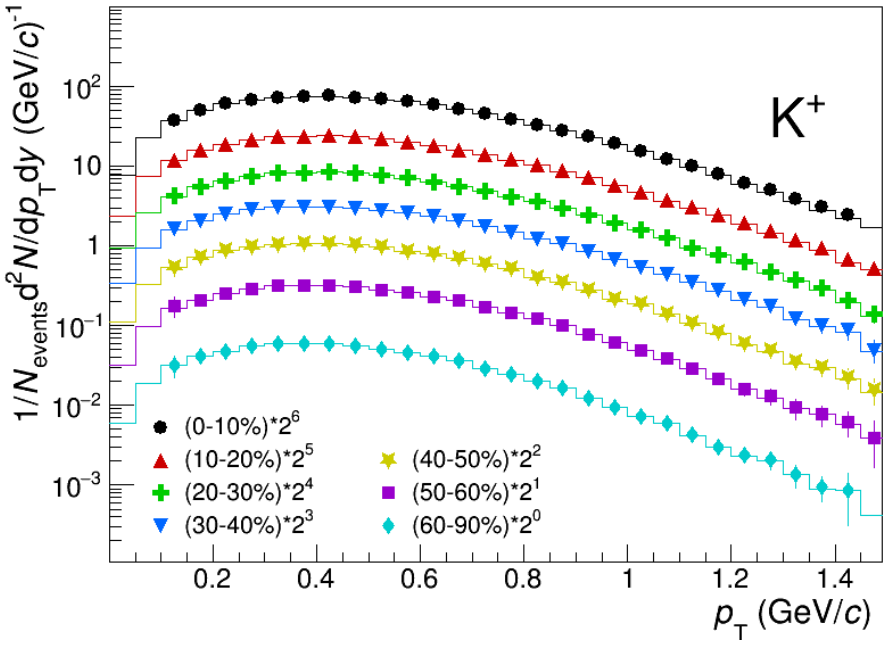
Final Spectra, protons

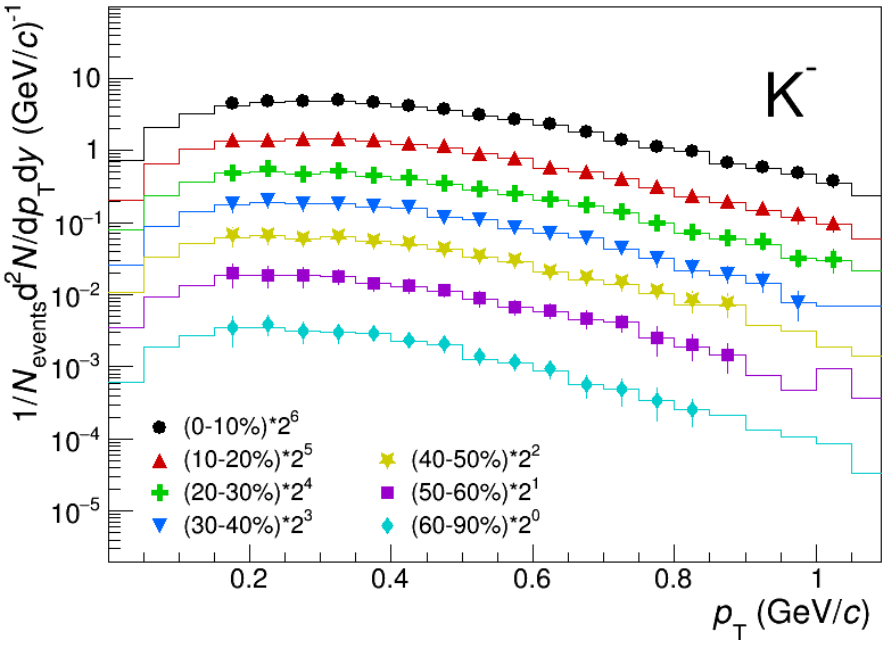




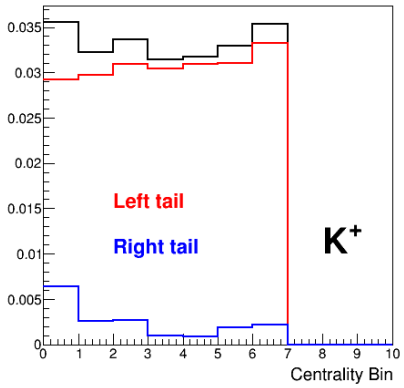
- Start at p_T ~ 100 MeV/c
- Measured spectra sample ~97% of the total yields, loose ~3% at low p_T, high p_T reach limited only by statistics

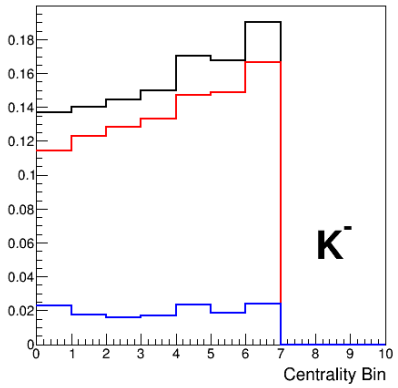
Final Spectra, kaons





- Start at p_T ~ 100(150) MeV/c for $K^+(K^-)$
- Measured spectra sample ~96(85)% of the total yields for $K^+(K^-)$, main losses at low p_T





Summary

- A very straightforward approach for π/K/p measurements is proposed → good for the first-day measuments
- Generated spectra are soft → reconstruction of low p_T part is very crucial
- Losses at high p_T negligible and/or statistic dependent
- Losses at low pT is ~ 3-5% for pions, protons and K^+, ~15% for K^-
