

Slow Control System of the BM@N experiment

The 29th International Scientific Conference of
Young Scientists and Specialists

ASSOCIATION OF YOUNG
SCIENTISTS AND SPECIALISTS OF JINR

I. Osokin

on behalf of Slow Control group:

V. Dronik, D. Egorov, R. Nagdasev, V. Shutov

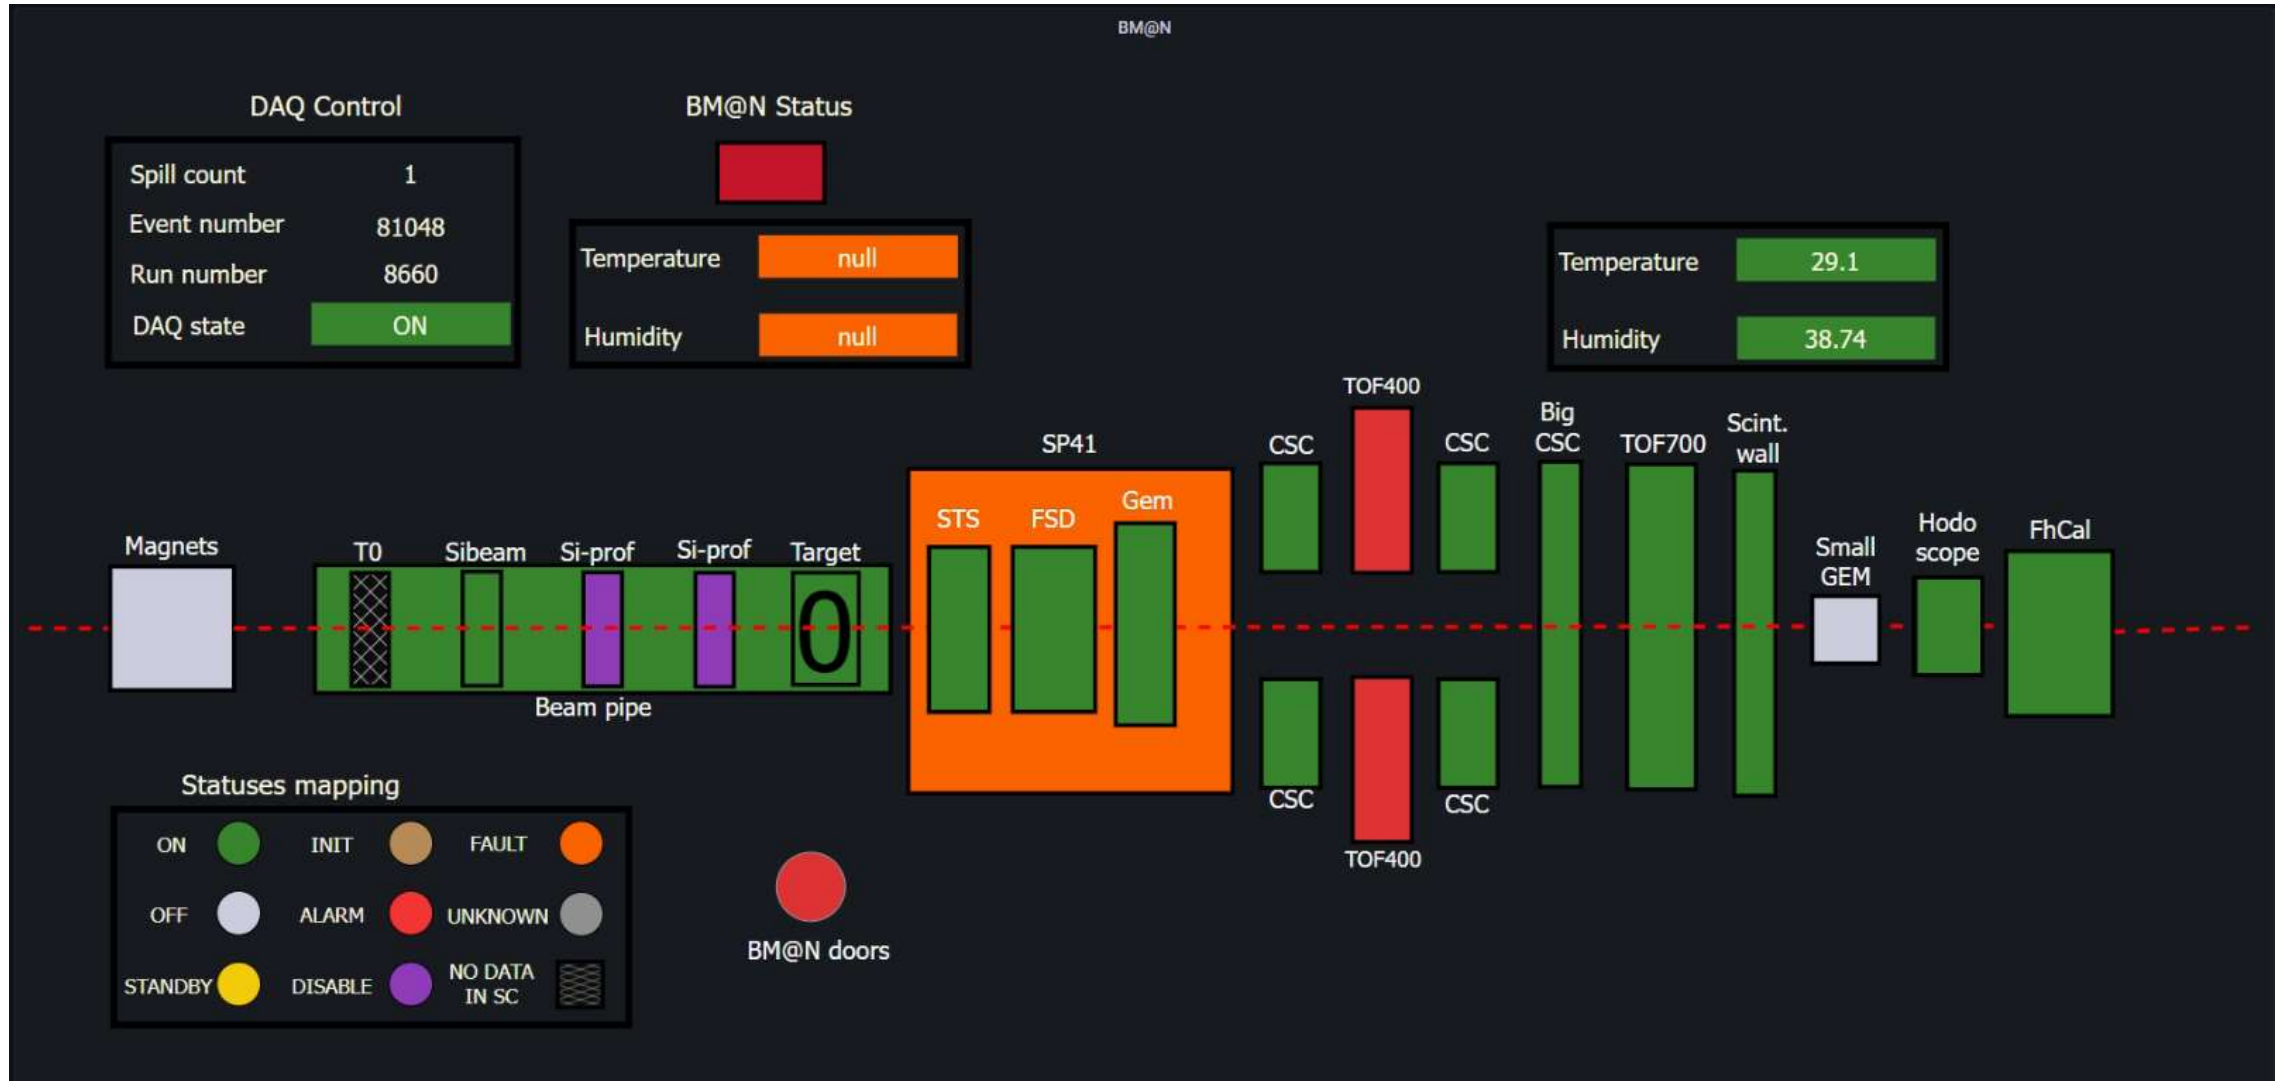

30.10.2025

BM@N building in NICA complex

BM@N experiential hall:

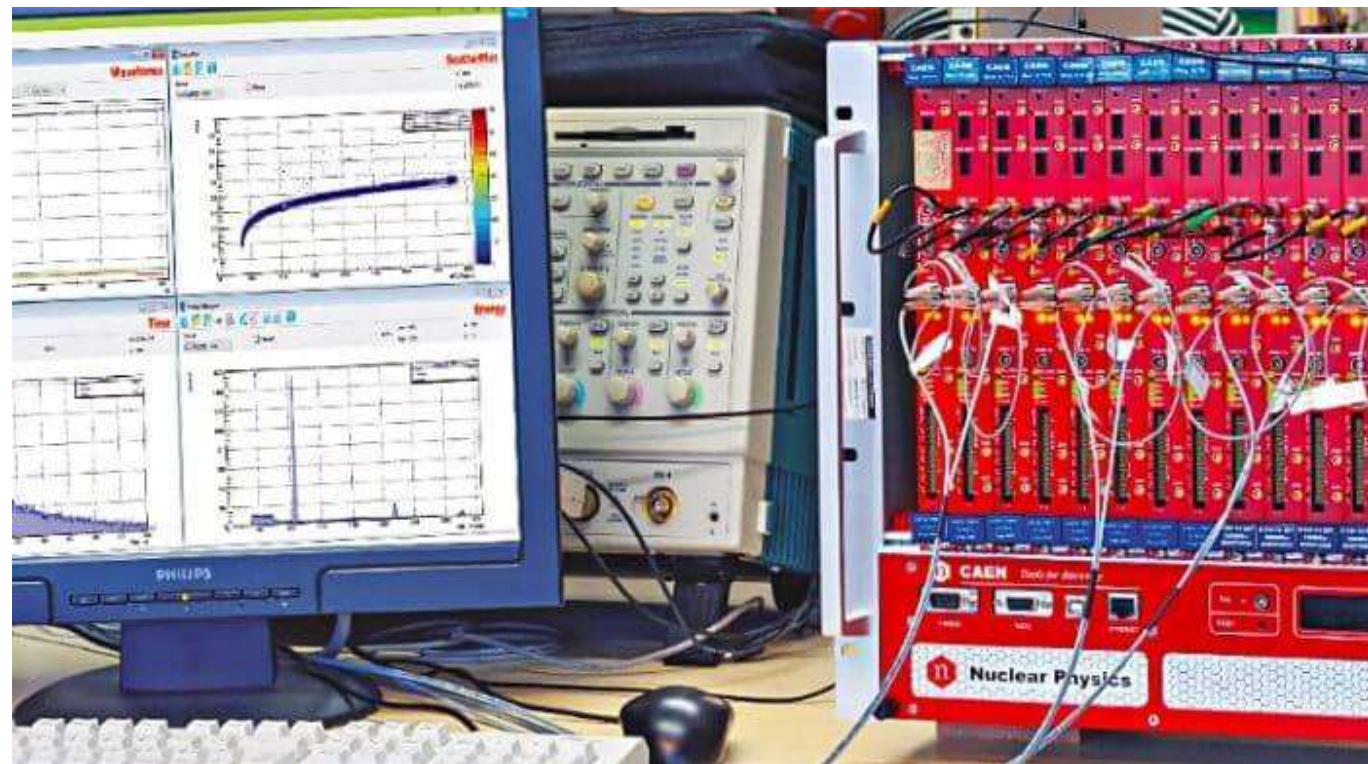

What is Slow Control?

- Monitoring of the experimental hardware.
- Centralized control of the Slow Control equipment (LV, HV, gas flow etc.)
- Archiving Slow Control data.
- Alarm system.
- SC Configuration database.

Not a Slow Control:

- Main data stream (DAQ).
- Event builder (reconstruction)/event display.
- Data quality.
- Run control.

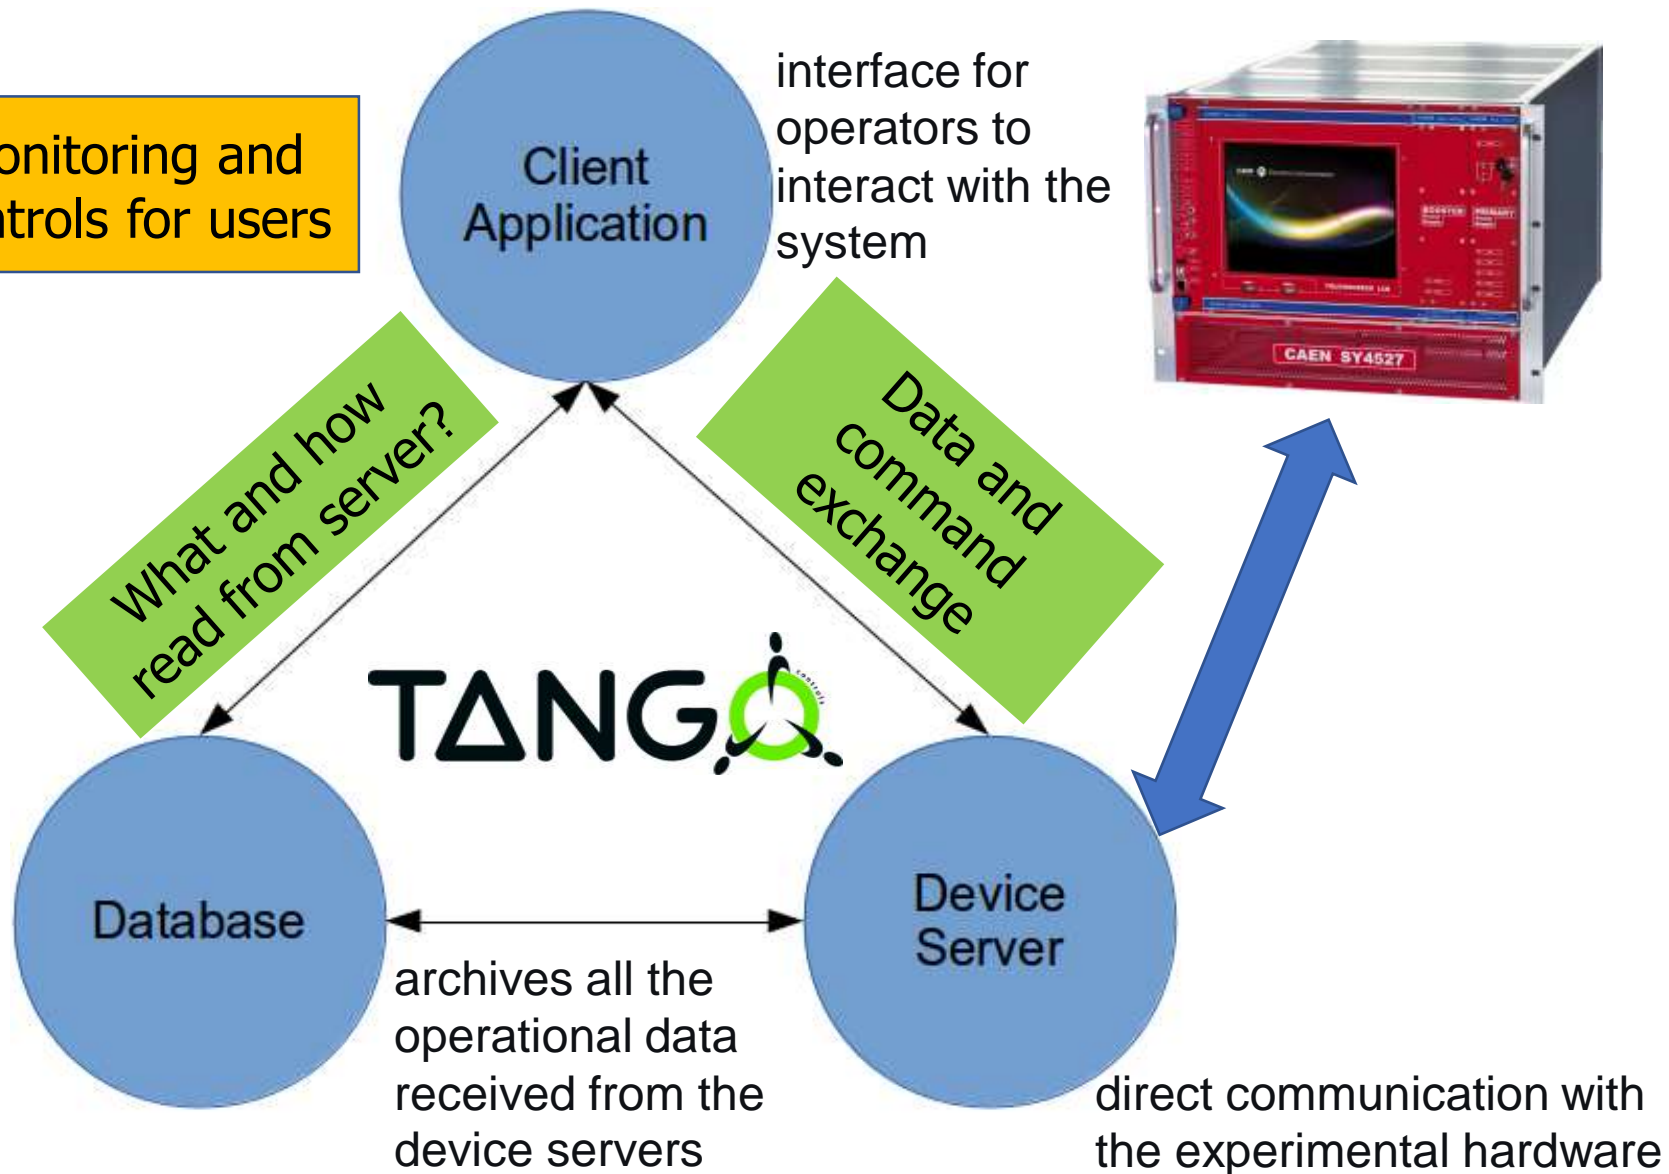

What is Slow Control?

Monitoring and controls for users

Tango-based Slow Control System has performed well in previous runs and will be used in the forthcoming run

CS analogs:

Tango Controls is an object oriented, distributed control system. It is a framework for building custom SCADA systems. Tango defines communication protocol and API. It provides libraries, set of GUI tools and drivers (so called Device Servers)

- Multiplatform
- Archiving service
- Access control service
- Logging service
- Alarm service
- Configuration tool
- Administration tool
- Web interface
- Code generator for C++, Java, python
- GUI Toolkit for Java, QT, Python

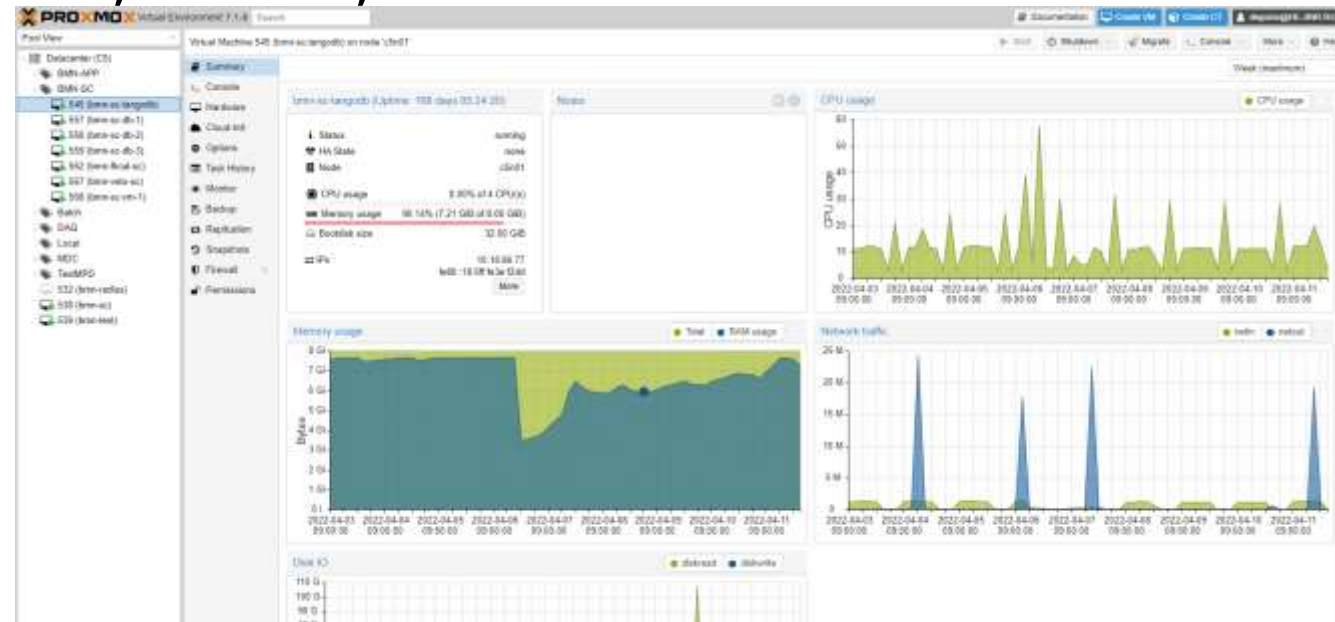

Infrastructure – computing, devices, interfaces

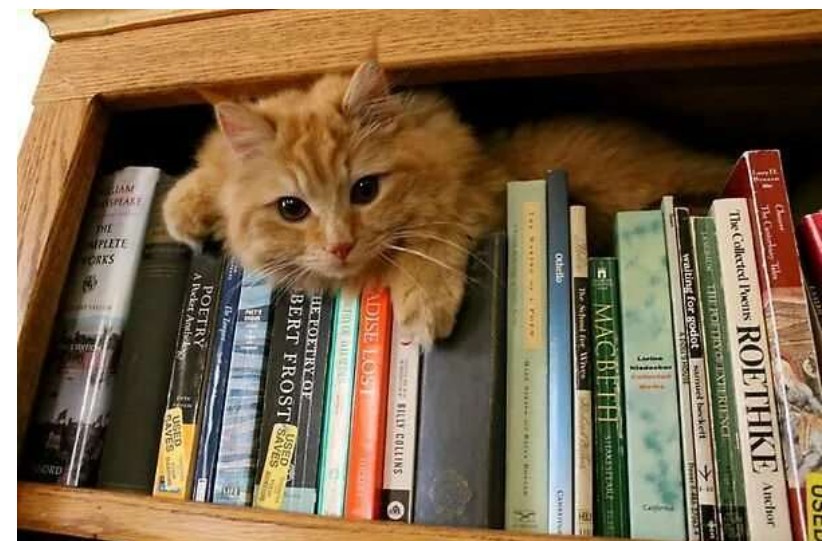

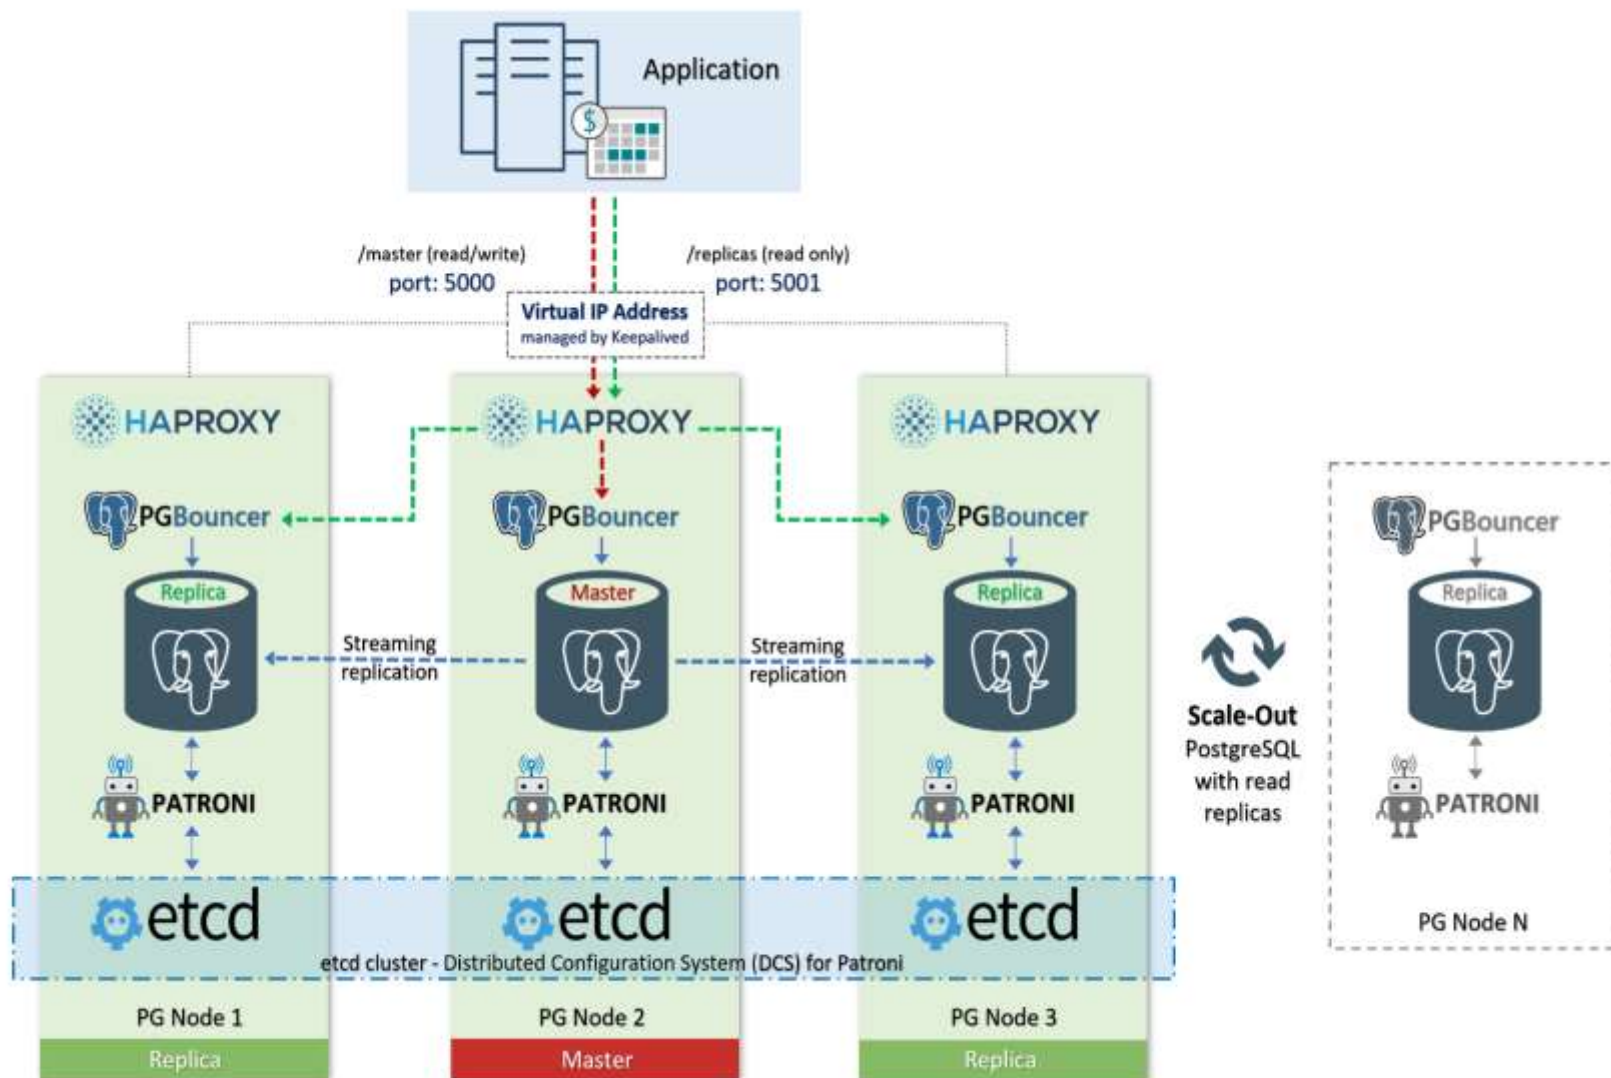

At present time the service layer tasks uses existing MPD/BM@N computing farm. Virtualization is done using PROXMOX Virtual Environment.

All centralized services are running on dedicated VM's

Front-end layer includes a wide variety of devices which are uses different buses and protocols, such as PXI, Ethernet, RS-485, RS232 etc.

Database cluster

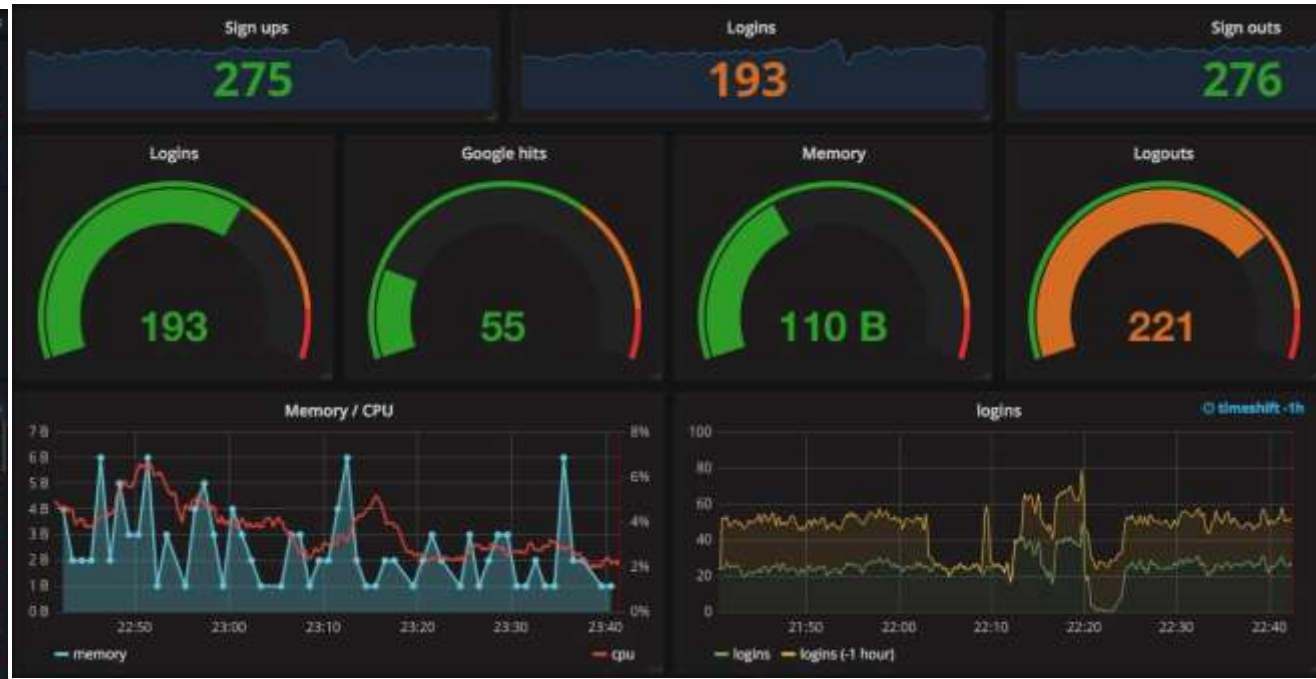

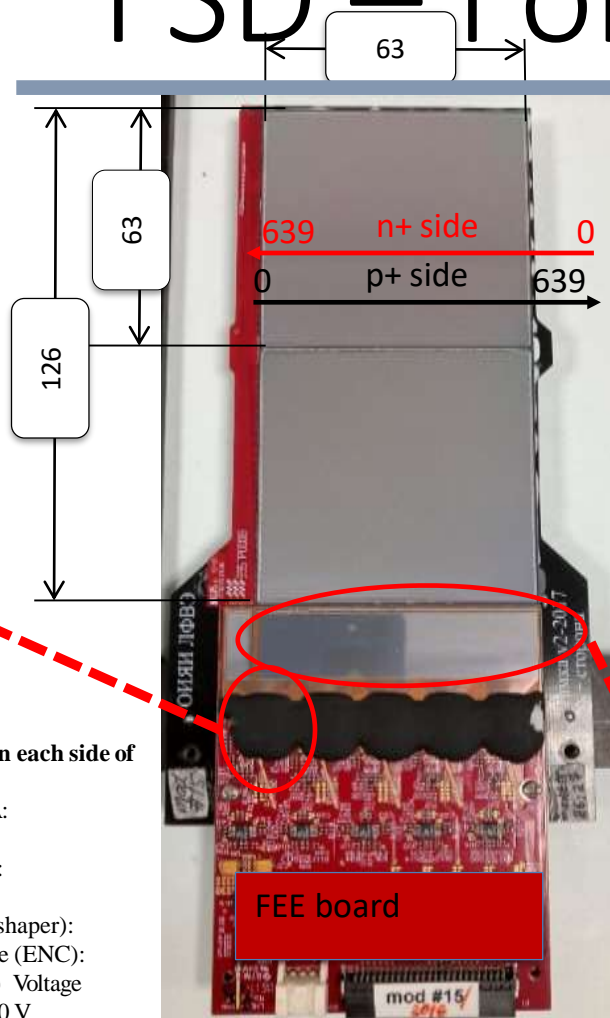

All BM@N data is archived in a PGSQL database deployed on a cluster consisting of three self-replicating virtual machines, which increases the system's reliability and fault tolerance.

Grafana

Grafana is a free software data visualization system focused on IT monitoring systems data. It is implemented as a "dashboard" style web application with charts, graphs, tables, alerts.

ASIC VATA GP7.2 (5 chips on each side of module)

Number of CSA:

128 channels

Dynamic range:

± 30 fC

Peaking time (slow/fast shaper):

500 ns/ 50ns Noise (ENC):

70e +12e/pF (typ.) Voltage

supply: +1,5 V, -2,0 V

Gain from input to output buffer: 16,5

$\mu\text{A/fC}$ Output Serial analog multiplexer

clock speed: 3,9 MHz

Power dissipation per channel: 2,2

mW

Pitch Adapter (n+) side

Number of channels: 640

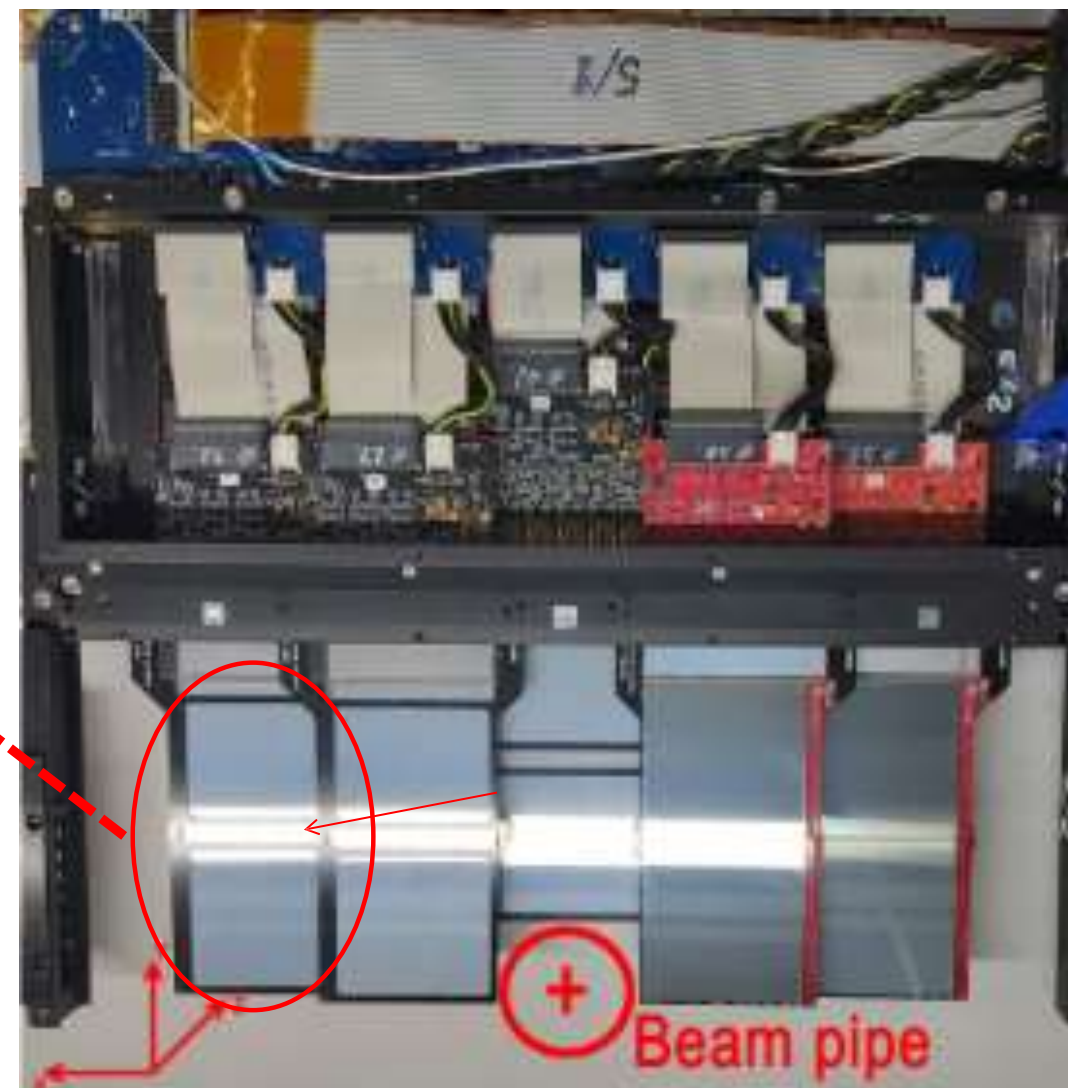

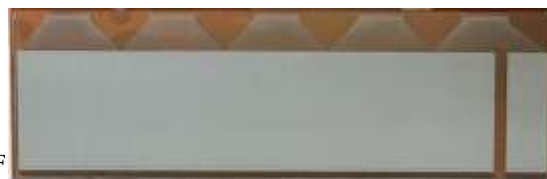

Value of poly-Si resistors: ≈ 1 M Ω

Value of integrated capacitors: ≈ 120 pF

Capacitor working voltage: 100 V

Capacitor breakdown voltage: >150 V

The average value of the dark current at the beginning of the session is $0.761 \mu\text{A}$, measured at a temperature of $+22.5^\circ\text{C}$; the average value of the dark current at the end of the session, for a reason radiation damage, is $12.7 \mu\text{A}$,

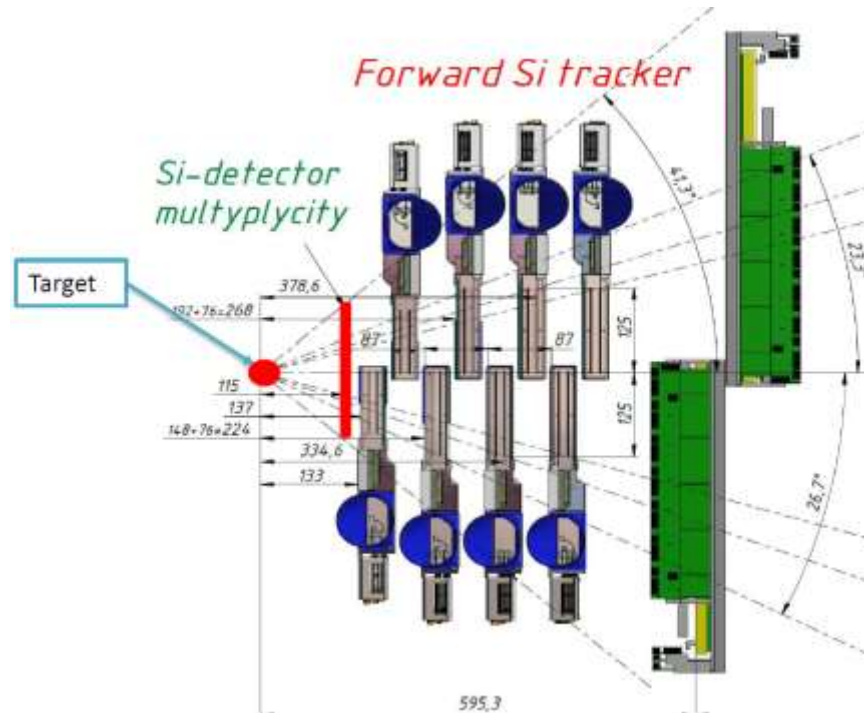

The change in detector currents at three beam tracker stations during the BM@N SRS 2022-2023 session is shown.
