<sup>3</sup> Federal Medico-Biological Agency (FMBA)

The task is to study the internal structure of subjects without breakings and cutting. The medical CT methods which exist nowadays suffer from many different difficulties (blurred zones on images). The practical application involves the analysis and visualization of CT data including **transmission (a)** and **emission (b)** processes.

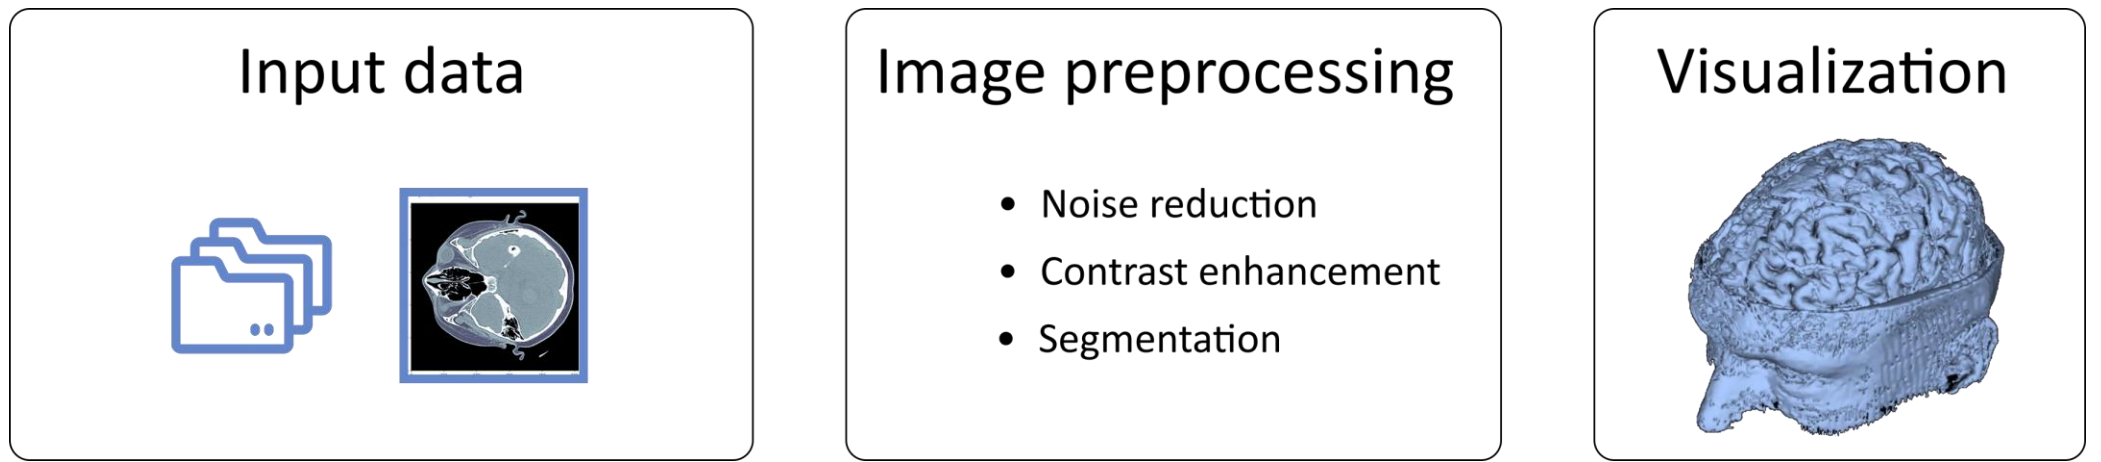

The purpose of project is the development of CT data visualization and possible improvements of CT images which should eliminate the blurred zones.

In practice, the original slice function differs from the reconstructed forms. Our principal goal is to minimize the mentioned difference using a new mathematical method. To this aim, as a preliminary stage the corresponding polygon of CT-data analysis is planned to be created.

## CT data workflow

## Component for educational purposes (without GPUs)

**For teaching students**

<https://studhub1.jinr.ru>

**For conducting workshops within the framework of JINR scientific events**

**Nipype:**  
Neuroimaging in Python  
Pipelines and Interfaces

FreeSurfer

PENNYLANE

Server Characteristics:

- 2x Intel Xeon Gold 6126, 48 core @ 2.60 GHz
- 256 GB RAM

**Working** in the Polygon:

Access to the Polygon is provided from the JINR network.

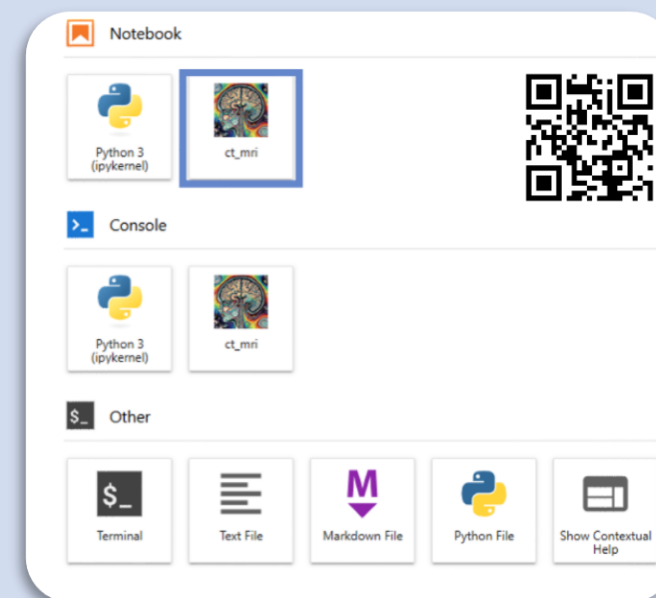

To getting access to the polygon's resources you need send an email to one of the administrators with your login: [<aanikina@jinr.ru>](mailto:aanikina@jinr.ru), [<zuevmax@jinr.ru>](mailto:zuevmax@jinr.ru). In response, you will receive an email confirming access and a password to the Polygon.

The JupyterLab interface was installed on the Polygon with a configured [ct-mri](#) environment in the form of a separate "button" for working with installed Python libraries.

# A polygon for working with CT and MRI/fMRI data of brain

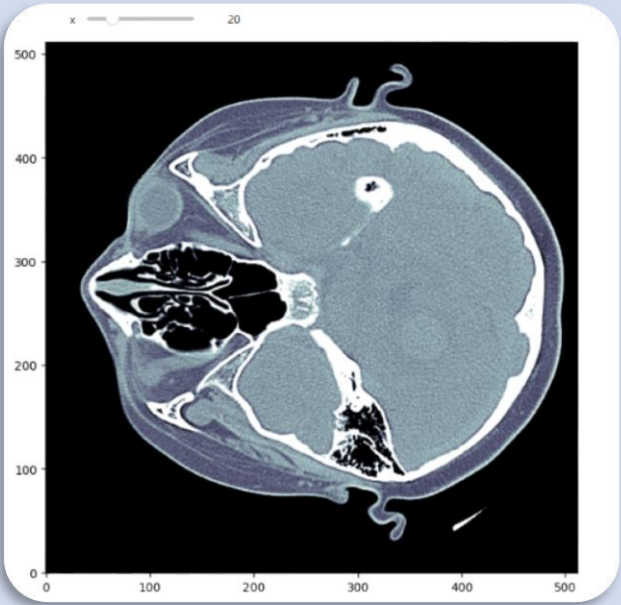

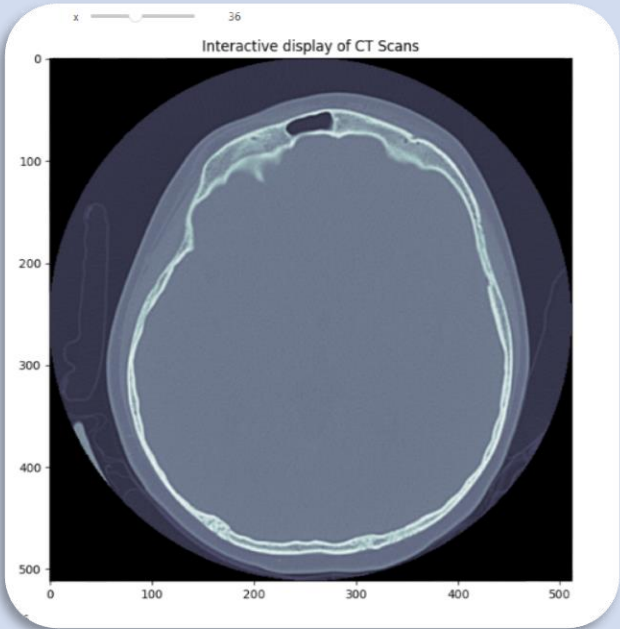

## JupyterLab interface

- **PyDicom** is a Python package used to read, modify, and write DICOM (Digital Imaging and Communications in Medicine) files, which are used in medical imaging.
- **Nipype** (Neuroimaging in Python - Pipelines and Interfaces) is a Python-based software package for analyze data using a variety of different algorithms.
- **PySurfer** is a Python library for visualizing cortical surface representations of neuroimaging data.

## SSH-access

- **MRI Convert** for converting the NIFTI file from the original set of DICOM files;
- **FreeSurfer** for NIFTI file processing;
- **FreeView** (viewer from the FreeSurfer package) for building images after NIFTI file processing.
- **FSL**, alternative package for NIFTI file processing;
- **FSleyes** (viewer from the FSL package) for building images after NIFTI file processing

For the visualization of medical computed tomography data, the polygon based on heterogeneous platform “HybriLIT “ has been developed. The **main purposes of polygon** are

- 1) CT and MRI/fMRI data storage;
- 2) the visualized work with data in web-browser thanks for the possibility to work within JupyterLab interactive environment ;
- 3) the visualization of results using the special software;
- 4) the software development;
- 5) mathematical modeling.

In the further work, after implementation of new mathematical methods, visualization and medical data analysis the polygon has to help for the restoration of images. This is the principal goal which should minimize the blurred zones of images and the X-ray radiation of patients.

**Thank you for attention!**
