gfal-copy davs://party1/file davs://party2/file
```

Third-party-copy

GridFTP status

- Supports TPC since ~ 2005
- Used almost exclusively for production TPC transfers
- General support for Globus Toolkit ended in 2017
 - Commercial Globus Connect
 - [Grid Community Toolkit](#)
 - fork of original open source Globus Toolkit
 - maintain existing tools including GSI and GridFTP
 - support at least till 2021
 - significant effort necessary with each OpenSSL ABI changes
 - catalyst to think about modernizing whole storage infrastructure
- [WLCG DOMA working group](#)
 - Access, content delivery and caching
 - QoS
 - TPC

WLCG DOMA – TPC

- **TPC subgroup** – find alternative protocol(s) for GridFTP
 - **Phase 1** (end of 2018) – survey replacement protocols available in common storage implementation, prototype / implement support TPC
 - **Phase 2** (mid 2019) – early deployment phase to ensure alternative protocol at all WLCG sites with > 3PB storage
 - **Phase 3** (end 2019) – widespread deployment when all WLCG storages must support non-GridFTP protocol
- GridFTP still considered for transfers between sites without matching alternative protocol
- Participants (developers, testers, site / storage admins)
 - XRootD, dCache, DPM, EOS, StoRM, Echo, also Rucio, FTS, gfal
- Related WLCG task forces
 - **DPM Upgrade task force**
 - GGUS ticket with request to upgrade submitted recently
 - **dCache upgrade task force**

WLCG DOMA – TPC

- Criteria for evaluating new protocols
 - Requirements
 - well documented (e.g. [Open Grid Forum](#))
 - multiple implementation (necessary for standardization)
 - secure as GridFTP (as it is used by WLCG – no data encryption)
 - support multi-VO storage system
 - Desirable
 - improved security (stronger data integrity and privacy)
 - support universal endpoints (no VO specific gateway)
 - support for non-X.509 authentication (tokens)
 - support industry standard protocols (e.g. S3 via HTTP)
- Available alternative protocols already supported by storages
 - [XRootD](#)
 - [WebDAV](#)

XRootD TPC

- Basic support since ~ 2010
 - not sufficient for general use cases
 - missing support for credential delegation
 - local valid grid proxy necessary
 - not scalable and reliable enough
- XRootD 4.9.x with grid proxy delegation support
 - xrootd security protocol updated and [documentation improved](#)
 - implemented also by dCache 5.x (two implementation)
- [TPC transfers](#)
 - destination endpoint with delegated credentials pulls files from source
- Upcoming XRootD 5.x
 - encryption support
 - allows to specify which communication must be encrypted
 - including data transfer encryption

HTTP TPC

- Utilizing existing WebDAV “COPY” verb ([RFC4918](#))
 - additional headers for AuthZ described in [technical documentation](#)
 - support for different AuthZ (gridsite proxy delegation, tokens)
 - performance markers for monitoring copy progress
 - communication finished with “success: Created” / “failure: msg”
 - implemented by DPM, dCache, StoRM, XRootD, Dynafed
- [TPC transfers](#)
 - pull mode – client ask destination to download data from source
 - push mode – client ask source to upload data to destination
 - sufficient if just one party supports TPC

COPY /store/path HTTP/1.1
Host: **storage.site1.com**
Source: **https://storage.site2.com/store/path.src**
Authorization: **Bearer abcdef**
Copy-Header: Authorization: **Bearer 12345**

storage.site1.com

storage.site2.com

GET /store/path.src HTTP/1.1
Host: **storage.site2.com**
Authorization: **Bearer 12345**

TPC Functional Tests

- Rucio dteam VO testbed for TPC transfers
 - all participating sites tested every hour with each other
 - Rucio transfer traces collected by MWT2 elasticsearch / kibana
 - filter failed transfers → provides link to FTS details
 - FTS with debug loglevel

TPC Functional Tests

- ATLAS has own production transfer monitoring ([NEC2019](#))
 - recently new functional tests for individual protocols
 - selected production endpoint probed with XRootD and WebDAV TPC
- Quite different picture from testbed
 - not all production FTS servers updated to version supporting XRootD
 - some FTS servers configured with HTTP streaming
 - storage software with proper TPC support released recently (months)
 - number of storage endpoints without XRootD checksum support
 - checksum validation was disabled for DOMA TPC testbed

TPC Stress Tests

- Production endpoint stress tests with XRootD and WebDAV TPC
 - 250 transfers with 4GB files scheduled every hour between each site
 - 1.25PB transferred every week (more than 300k transfers)
 - still just ~ 5% of average transfer volume within single LHC experiment
 - reaching up to 50Gb/s hourly transfer rate
 - failure rate still needs to be better understood
 - throughput comparison GridFTP vs. XRootD vs. WebDAV not yet done

TPC Stress Tests

- Production endpoint stress tests with XRootD and WebDAV TPC
 - 250 transfers with 4GB files scheduled every hour between each site
 - 1.25PB transferred every week (more than 300k transfers)
 - still just ~ 5% of average transfer volume within single LHC experiment
 - reaching up to 50Gb/s hourly transfer rate
 - failure rate still needs to be better understood
 - throughput comparison GridFTP vs. XRootD vs. WebDAV not yet done

WebDAV transfer throughput Mb/s

TPC Smoke Tests

- Available for both protocols – [WebDAV](#) and [XRootD](#)
- Provides much more diagnostic details about TPC storage support
 - test both pull and push mode for HTTP
 - testing compliance with TPC standard
 - different credential delegations
- Executed automatically every day
 - each storage participating in TPC testbed
 - all results sent by email to storage administrators
 - simple statistic collected including historical data
- Can be executed by site/storage admins
 - dteam VO X.509 proxy necessary to run smoke test
 - otherwise daily reports provides same info

Software with TPC support

- [WLCG software baseline](#) updated
 - minimal storage version with TPC support
- Storage baseline for TPC
 - XRootD: 4.10.0 (July 2019)
 - 4.11 brings fixes necessary for Echo (soon)
 - DPM: 1.13.2 (October 2019)
 - dCache: 5.2 (July 2019)
 - WebDAV TPC functional since 3.2
 - dCache < 4.2 already [EOL](#)
 - EOS: 4.5.6 (August 2019)
- Other software
 - gfal2: 2.16.3, gfal-utils: 1.5.3
 - davix: 0.7.2
 - [FTS: 3.8.3](#)

FTS

- TPC transfers (XRootD) requires at least 3.8.3
 - Current status
 - FTS prod @CERN → xrootd ok, http ok - pull & push
 - FTS devel @CERN → xrootd ok, http ok - pull & push
 - FTS pilot @CERN → xrootd ok, http ok - pull & push & streaming
 - FTS @BNL → xrootd ok, http ok - pull & push
 - FTS @RAL → xrootd plugin not installed, http ok - pull & push & streaming
 - FTS @FNAL → old version not supporting xrootd delegation, old gfal version, http ok - pull & push & streaming
- http streaming
 - fallback from TPC to normal copy
 - data transferred through FTS
- http pull & push – unexpected transfer “retry”
- http TPC was causing excessive logging with old dCache versions

Rucio

- Only third_party_copy activity in Rucio configuration
 - unable to distinguish configuration for active / passive party in TPC
 - non-GridFTP sites can't work properly
 - workaround with distance config necessary to protect other transfers
 - Needs development and database schema update
 - postponed for next major release
 - Rucio coding camp
 - available in October
- Multi-hop support
 - necessary for CTA
 - two sites TPC protocols intersection empty → multi-hop
 - utilize existing FTS multi-hop functionality
 - temporary copy registered in Rucio (secondaries)
 - a lot of corner cases makes implementation non-trivial
 - ATLAS wants both protocols deployed to prevent multi-hop transfers

Data transfers encryption

- In future all transfers will be probably encrypted
 - HTTPS is necessary for TPC
 - XRootD will come with data encryption soon
- Server CPU has build-in support for encryption – AES-NI
 - usually 1 encryption unit per physical core
 - 5Gb/s with single HTTPS connection on low-end modern CPU
 - 16 cores saturate easily 40Gb from mem
 - real file transfers limited by disks
 - 1Gb/s on our oldest storage servers
 - can become quite busy with 10Gb
- Less resources for BEER ([NEC2017](#), [CERN-IT-Note-2019-001](#))

CPU	openssl	HTTPS one	HTTPS mem	HTTPS disk
2x8core Intel Silver 4108	279.8Gb	4.2Gb	40Gb on 40Gb	30.0Gb disk lim.
2x6core Intel E5-2620	77.7Gb	2.3Gb	10Gb on 10Gb	N/A
2x4core Intel E5620	8.6Gb	0.9Gb	N/A	N/A

AES-NI CPU utilization test – disk

- CPU utilization while reading 1GB files from disk and sending them using apache with average speed ~ 30Gb/s (limited by disk read throughput). HTTPS stream encrypted with TLSv1.2,ECDHE-RSA-AES256-GCM-SHA384,2048,256 vs. simple HTTP test
 - CPU load details from /proc/stat
 - one minute load average, network transfer throughput

Summary

- Third-party-copy now available for WebDAV and XRootD
- Implementation exists for all grid storage implementations
- Functional tests works between all implementation
- Stress tests in progress – already use production instances
- Only very recent storage releases provides sufficient TPC support
 - WLCG ask sites to upgrade (GGUS)
 - Provide at least one non-GridFTP protocol
- Most of FTS servers supports TPC with WebDAV and XRootD
- Rucio should be ready with next major version released in October
- Upgrading majority of storages → GridFTP could become optional
- WLCG DOMA activities not limited to TPC
 - caching, quality of services, authorization, storage organizations, ...
 - more changes coming in near future, TPC TF continue with tokens

BACKUP

ATLAS Rucio TPC Configuration Test

- Rucio doesn't currently properly support active / passive TPC party
 - ATLAS configuration often fails TPC with lower priority protocols
 - doesn't affect production transfers that always use SRM/GridFTP
 - protocol with highest priority

AES-NI & OpenSSL performance

	2x Intel Xeon Silver 4108		2x Intel Xeon E5-2620 v2		2x Intel Xeon E5620	
cipher	#streams	speed Gb/s	#streams	speed Gb/s	#streams	speed Gb/s
aes-128-cbc	1	6.0	1	3.6	1	2.0
	16	95.1	12	43.0	8	15.5
			24	78.4		
aes-128-gcm	1	33.8	1	6.7	1	1.4
	16	385.8	12	70.9	8	10.3
			24	83.0		
aes-256-cbc	1	5.7	1	2.8	1	1.5
	16	68.9	12	31.0	8	12.3
			24	61.3		
aes-256-gcm	1	24.0	1	6.0	1	1.2
	16	279.8	12	61.3	8	8.6
			24	77.7		

AES-NI CPU utilization test - memory

- Machine utilization transferring data from memory with Apache
 - bumps in graph corresponds to this settings
 - https TLSv1.2,ECDHE-RSA-AES128-GCM-SHA256,2048,128, 32 connections, CPU load ~ 14
 - https TLSv1.2,ECDHE-RSA-AES256-GCM-SHA384,2048,256, 32 connections, CPU load ~ 14
 - http (no encryption), 32 connections, CPU load ~ 3.5
 - https TLSv1.2,ECDHE-RSA-AES256-GCM-SHA384,2048,256, 1 connection with throughput 4.2Gb/s
 - https TLSv1.2,ECDHE-RSA-AES256-GCM-SHA384,2048,256, 320 connections ~ load 310 but 40Gb still full

SRM-less operation

- Only LHCb still working on SRM-less
- ALICE use only XRootD
- ATLAS (CMS) needs storage space information formerly provided by SRM
- **WLCG Storage Resource Reporting (SRR) format** proposed
 - json format with basic data related to storage “spacetokens” (directories)
 - file provided by at least one supported protocol (GridFTP, XRootD, WebDAV)
- WLCG SRR implementation
 - DPM 1.10.3, since 1.13.2 available automatically via HTTP CGI at <https://dpmheadnode.example.com/static/srr>
 - dCache 4.2
 - StoRM 1.11.13
