

Virtual Laboratory – Virtual Educational Tools and Hands-on Practicum

KSENIYA KLYGINA

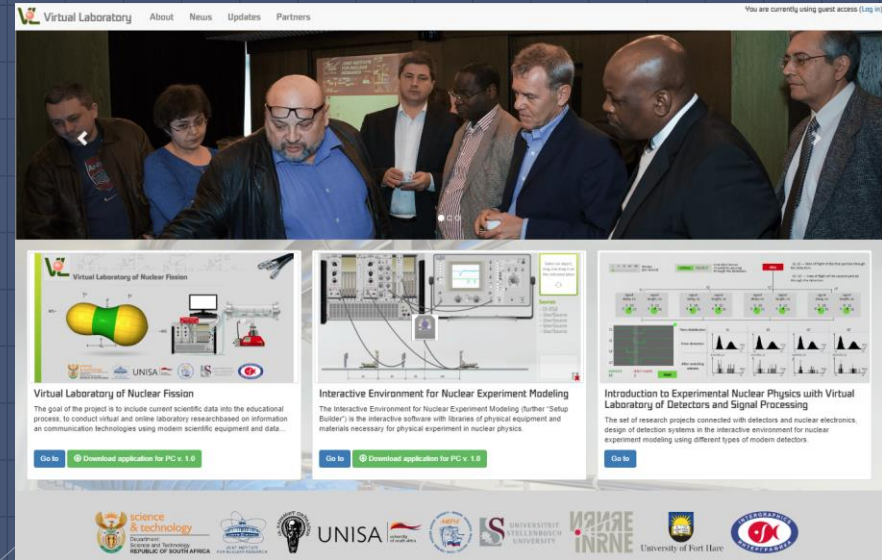

JINR 27th Symposium on Nuclear Electronics and Computing – NEC'2019

Budva, Montenegro

30 September – 4 October, 2019

PROJECT “VIRTUAL LAB”

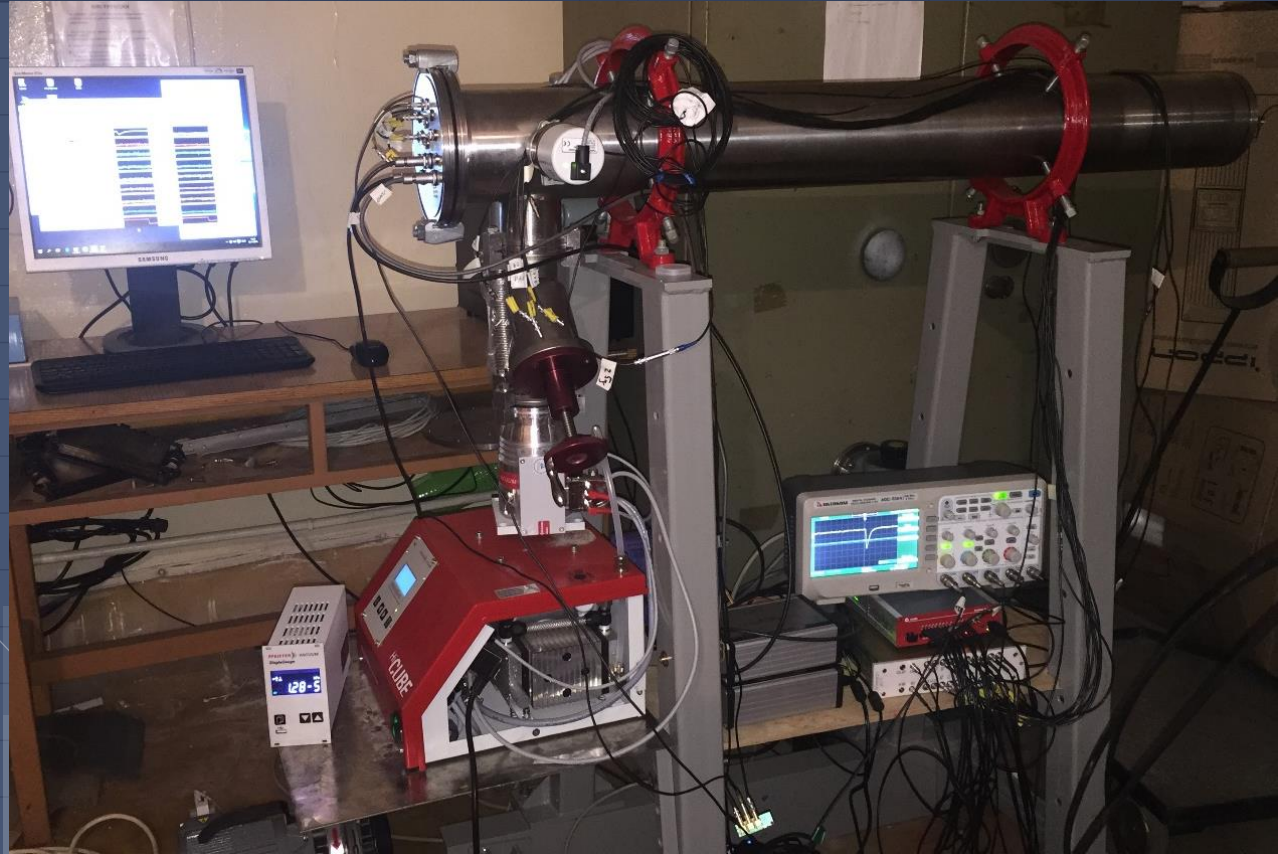

The **goal of the project** is to include current scientific data into the educational process, to conduct virtual and online laboratory research based on using modern scientific equipment and data obtained from the existing physical facilities.

PROJECT “VIRTUAL LAB”. BEGINNING

THE PROBLEM:

How to train students and young specialists to work with modern equipment and real experimental data?

CURRENT STATUS

New structure:

- Introduction to Experimental Nuclear Physics
- Laboratory of Nuclear Fission
- Laboratory of Gamma Spectrometry
- Laboratory of Data Analysis in ROOT
- Laboratory of Detectors and Data Processing
- Interactive Environment for Nuclear Experiment Modeling
- Hands-on Practicum

VIRTUAL LABORATORY OF GAMMA SPECTROMETRY

- Scintillation gamma spectrometer
- Semiconductor Ge(Li) gamma spectrometer
- X-ray measurements. Moseley's law
- Attenuation of gamma radiation (remote experiment)
- ROOT for gamma spectroscopy
- Practical task from low background laboratory

Laboratory of Gamma Spectroscopy

Laboratory of Gamma Spectrometry allows students to take part into the virtual experiments at different gamma spectrometers aimed to solve various scientific problems.

*****
ROOT 5.34/38 (v5-34-38@v5-34-38, Mar 12 2018, 15:49:59 on win32)
Z:\T\ROOT C:\C++ Interpreter version 5.10.00, July 2, 2010
Type ? for help. Commands must be C++ statements.
Enclose multiple statements between { }.
root [0] .cd e:/GoogleDrive/userToVMI/CosmicRay4
root [1] .x spectraGauss_Co60_1_20may2019_fitCh.c

```

Figure 3. Commands for compile a code in the Root system

Step 3: Select the part of the spectrum along horizontal axis press the left mouse button on the initial position of the peak (about 380), drag it along the axis and release at the end position of the peak (about 430). The spectrum should look like Figure 5.

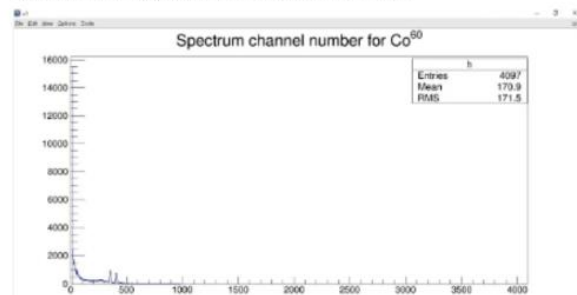

Figure 4. Spectrum for Co⁶⁰

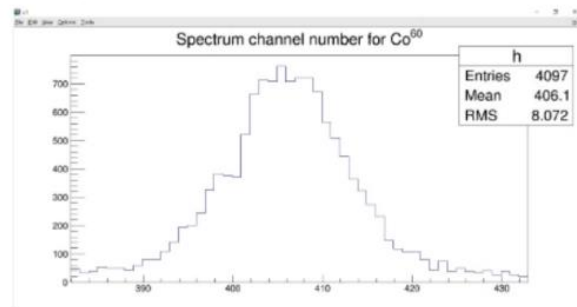

Figure 5. The selection part of spectrum

Step 4. Fit the peak. Right click on the peak and choose fit panel on the dropdown menu. The new fit panel window opens like below image.

HANDS-ON PRACTICUM

STUDENT PRACTICES

STUDENT PRACTICES

Lectures of JINR professors and leading specialists

Lab exercises

Virtual labs as training before working with real equipment

Work with real experimental setups

PRACTICUM FOR BEGINNERS

Basics of electrical pulse measurements:

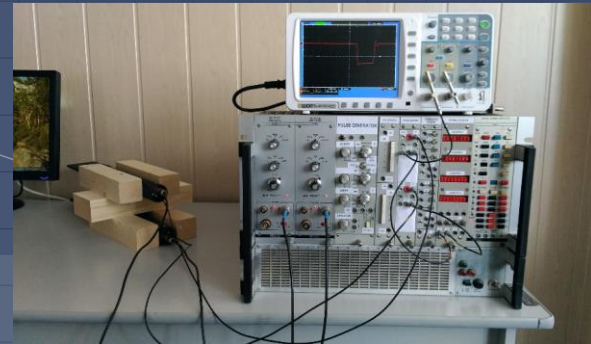

- work with a digital oscilloscope and a pulse generator,
- study of signals from a pulse generator;
- study of the signal delay in cables,
- study of CAMAC crate,
- work with CAMAC blocks: delay module, counter, signal splitter,
- study of coincidence counting.

PRACTICUM FOR BEGINNERS

Study of cosmic rays:

- work of scintillation counters,
- work with high voltage (HV) power supply,
- principles of work of coincidence scheme,
- calculation of the number of coincidences for two scintillation counters for a time period,
- calculation of the number of cosmic particles that enter 1 dm² of scintillation counter per 1 minute,
- observation of signals from cosmic radiation.

PRACTICUM FOR BEGINNERS

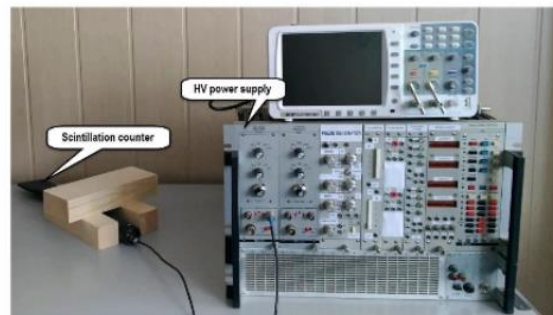

Telescope for studies of cosmic rays:

- to study 4-channel digitizer DRS4 with corresponding software,
- to study scintillation detector based on NaI crystal,
- to assemble a cosmic ray telescope,
- to study principles of work of the cosmic ray telescope
- to study spectrum from the cosmic ray telescope.

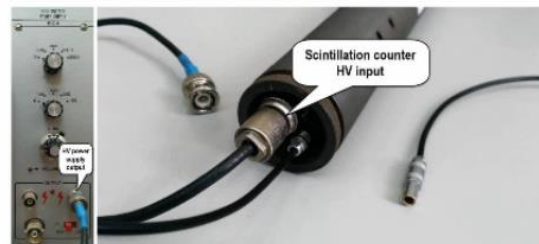

Lab instructions:

- 1) Feed high voltage to the scintillation counter No. 1.*

For this, using a cable, connect the output of HV power supply with HV input of the scintillation counter.

Attention! Work safely with high voltage power supply! Before work with the block of HV power supply, make sure that it is turned off and all the controls are zeroed. Then turn on CAMAC crate and turn on the block of HV power supply. Make sure that the activation indicator light went on.

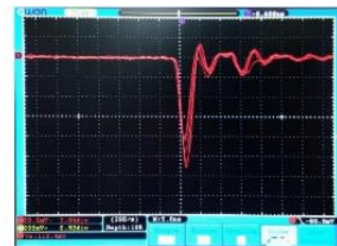

* The devices with power supply at the Station No. 1 and the Station No. 2 can differ from described in this document. See Annex 1 ("Power supplying of scintillation counters at stations No. 1 and No. 3") to this document.

- 2) Connect the scintillation counter with the oscilloscope.

- 3) Gradually increase the voltage until you will see stable signals on the oscilloscope screen.

3-day visit of school students from Israel

Education, 27 March 2019

Elena Simon, Physics teacher at HEMDA: "We had an opportunity to touch real experimental work here; it was the thing that we liked most about JINR. The experience of the last year showed that students were satisfied with lectures and excursions, but most of all they were impressed by hands-on activities. So this year we decided to concentrate on the practical part. This is the reason why we came back to JINR, and more likely we will come again in the future. We were able to show our students what modern experimental research is like. I would like to note that our group has been paid a lot of attention, we are very pleased and truly appreciate it. In our turn, we are trying to make our visit useful for the Institute, that is why we prepare and "tune" our students accordingly. It gives a possibility of testing the techniques that you develop, and, for our part, we are ready to give a feedback. The guys very appreciate the personality of G.N. Flinor. They took many photos next to his portrait because the great-niece of this outstanding scientist works in our Center. This cultural and historical connection of Dubna and Tel Aviv lives on, and our students always remember about it."

Farber Arzi Ori, student: "We came here to see "Big Physics" and high technologies by our own. We had studied in theory the largest part of what we saw here, and it was great to be able to touch it. Staying in Russia is unforgettable not only because of the weather but also because of the culture. We could feel what it is like to be a part of JINR. We listened to lectures in English and joined the international team for several days thus feeling that we were a part of it. We enjoyed hands-on work very much: it turned out to be the most valuable part of the visit for me."

OFF-SITE WORKSHOPS

USE IN EDUCATION

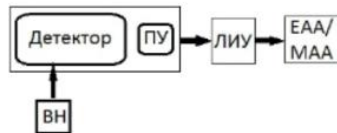

Калибриране на спектрометър

Това упражнение е съвместно благодарение на Програма за сътрудничество ОИЯИ – България

Цел на упражнението: Целта на това упражнение е да се осмисли процедурата по калибриране на спектъ, получен от източник на йонизиращо лъчение.

Детекторите на йонизиращи лъчения са един от основните инструменти на експерименталната ядрена физика и нейните приложения. Предназначението им е не само да регистрират наличието на радиация, но и да дават информация за енергията на частиците, тяхната траектория, скоростта и т.н. Отдадената и работния обем на детектора енергия на лъчението се превръща в достъпен за човека сигнал: регистриране на електричен импулс, светлина, фотографско изображение, звук. От вида на детектора зависи в какво ще се трансформира отдадената енергия. Тенденцията в съвременния ядрено-физичен експеримент е да се използват преди всичко детектори с електричен сигнал, тъй като те най-лесно позволяват включването на достиженията на съвременната електроника и компютри в следващия етап на обработка на информацията. В това упражнение няма да се спираме на изясняване действителното на всеки от основните детектори, а ще разгледаме най-общо принципа на един γ -спектрометър. На Фиг. 1. е показана неговата блок-схема.

Фиг. 1. Блок-схема на γ -спектрометър

Основните елементи са детектор за регистриране на йонизиращо лъчение, на който се подава високо напрежение (ВН). Импулсите от детектора се подават на входа на предусилвателя (ПУ), чиято роля е да предотврати затихването на сигнала по коаксиалните кабели до следващото стъпало – линейния импулсен усилвател (ЛИУ). На Фиг. 2 може да се види как изглеждат импулсите на изхода на усилвателя. Те са положителни с отрицателна "опашка". Последната се появява от свойствата на импулсния усилвател, който, освен че усилва импулсите, ги формира така, че амплитудите им да бъдат по-точно определени от дискриминатора (ампшудудния анализатор).
