Problem formulation

The software developed is an analyzer. The analyzer constructs a compressed spectral image.

NetFlow Architecture

Problem solution

1. Dynamics multiple spectral images of the traffic's parameters fluctuations.
2. Neuralsimilar compression of spectral data.
3. Point images.

Analyzer scheme

Example 1

Traffic is normalized.

a_1 and a_2 incoming traffic,
 b_1 and b_2 output traffic.

Example 1

- traffic0 — normal traffic.
- traffic1, traffic2 — overloaded traffic.

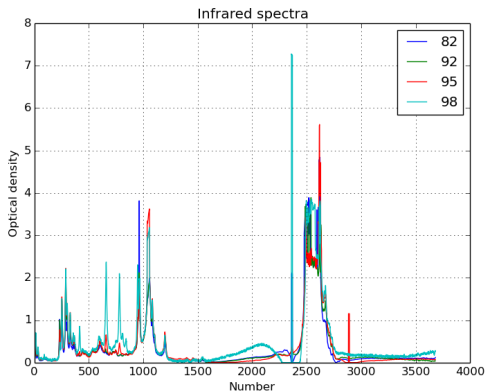

Example 1

The traffic compression result.

Example 2

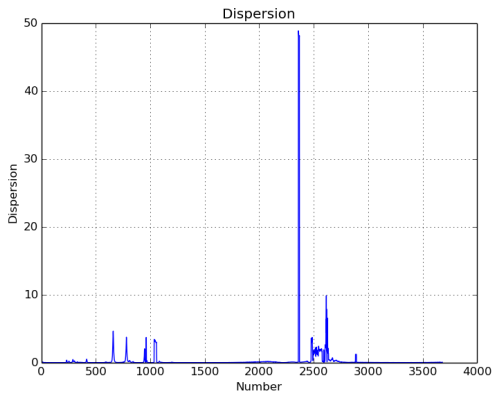

The problem of classifying gasolines according to their spectra.

Infrared spectra for gasoline.

Example 2

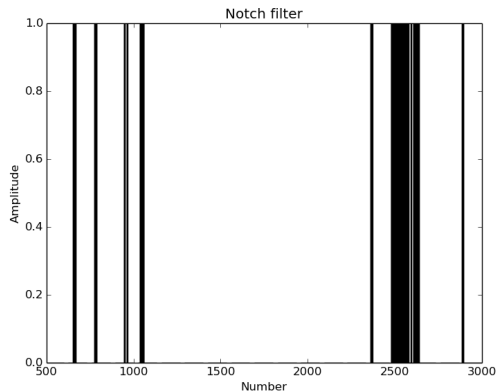

Calculate the dispersion.

Spectrum dispersion.

Example 2

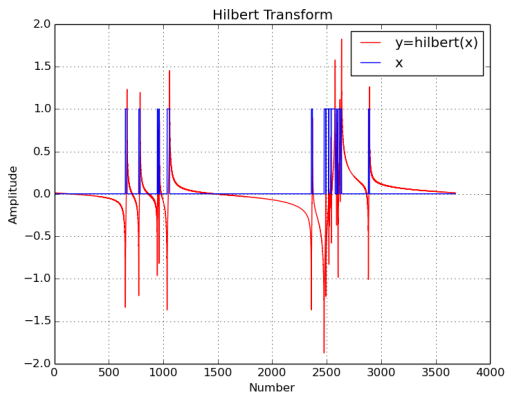

Filtered the data with a larger dispersion.

The first basis vector.

Example 2

Performed the Hilbert transform.

The second basis vector.

Example 2

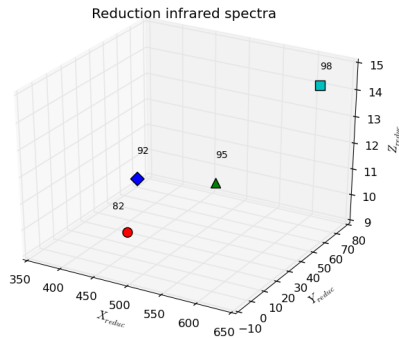

Performed the Gram Schmidt transformation.

The third basis vector.

Example 2

Projected into the basic space.

Reduced image.
